**Supplementary Figure S1.** Total and individual catechins concentrations in tea leaves as influenced by exogenous methyl salicylate (MeSA) as foliar spray. Leaf samples for catechins determination were harvested at 2 day post-treatment with 1 mM MeSA. The data of catechins concentrations were expressed as the mean values  $\pm$ SD, n=6. Means denoted by the different letters indicate significant differences between the treatments ( $P < 0.05$ ). (-)-epigallocatechin, EGC; (-)-catechin, C; (-)-epigallocatechin-3-gallate, EGCG; epicatechins, EC; epicatechins gallate, ECG; total catechins, TC.

**Supplementary Figure S2.** Time course of total soluble protein concentrations as influenced by exogenous methyl salicylate (MeSA). Tea bushes were sprayed with 1 mM MeSA. Line graphs with solid circle (●) and triangle (▲) represent data of control and MeSA treatment, respectively. The data were expressed as the mean values  $\pm$ SD, n=6.
