

Table S1. Summarizing table - the effects of each of the azoles on measured cell parameters.

	Parameter	Fc	Ep	Cb	Cl
Oxidative stress response	GSSG + GSH	↑↑	↑↑	ns	↑↑
	GSTs	↑↑	ns	↑↑	↓
Cell texture	Ra	ns	ns	↓↓	ns
	Rq	ns	ns	↓↓	ns
	R3z	ns	ns	↓↓	ns
Cell adhesion	Adhesion energy	↑↑↑↑	↑↑↑↑	↑↑↑↑	↑↑↑↑
	Adhesion force	↑↑↑	↑↑	↑↑↑	↑↑
	Cell surface hydrophobicity	ns	↓↓	↓↓	↓↓↓↓
Elastic properties	Deformation	↑↑↑↑	↑↑↑	↑↑↑	↑↑↑↑
	Young's modulus	↓↓↓↓	↓↓↓	↓↓↓↓	↓↓↓↓
	Stiffness	↓↓↓↓	↓↓	↓↓↓↓	↓↓↓↓

GSSG + GSH – the level of total glutathione; GSTs – activity of glutathione S-transferases;
Ra – roughness average; Rq – root mean square roughness; R3z – average roughness depth.

- **ns** – the modification was not significant (vs. control sample)
- the direction of the arrows indicates up-/down-regulation
- the number of the arrows indicates the strengths of the modification:
 - I – increase/decrease by up to 1.0-fold (vs. control sample)
 - II – increase/decrease within the range from 1.1 to 2.0-fold (vs. control sample)
 - III – increase/decrease within the range from 2.1 to 3.0-fold (vs. control sample)
 - IIII – increase/decrease by at least 3.1-fold (vs. control sample)
