## MATERIALS AND INSTRUMENTS

All solvents and reagents (Sigma-Aldrich, St. Louis, MO and Acros, Fair Lawn NJ) were used as received. T<sup>F</sup>PP [1] was either synthesized according to the literature procedure or obtained commercially [2]; T<sup>F</sup>PPZn [1] and T<sup>F</sup>PPPt [3] were synthesized by metal insertion into the free base according to literature procedures. TPP was synthesized according to a literature procedure [4]; is also commercially readily available.

All solvents were reagent-grade, or better, and were used as received. The CHCl<sub>3</sub> used was EtOH-stabilized (amylene-stabilized CHCl<sub>3</sub>, for example, is unsuitable for the osmylations!). CTAP was prepared as described in the literature [5].

Oxone<sup>®</sup> is an oxidizing agent; a mixture of the composition of 2KHSO<sub>5</sub>·KHSO<sub>4</sub>·K<sub>2</sub>SO<sub>4</sub>.

Aluminum-backed, silica gel 60, 250 μm thickness analytical plates were used for analytical TLC; Either 20 × 20 cm, glass-backed, silica gel 60, 500 μm thickness preparative TLC plates or standard grade, 60 Å, 32-63 μm flash column silica gel were used for the preparative chromatography.

<sup>1</sup>H and <sup>19</sup>F NMR spectra were recorded on a Bruker 300, 400 or 500 MHz instruments in the solvents indicated, and were referenced to residual solvent peaks or internal TMS. All UV-vis spectra were recorded on Cary 50 or 100 UV-vis spectrometers (Varian).

TWO-STEP PROCEDURE FOR SYNTHESIS OF *MESO*-TETRAPHENYL-2-OXA-3-OXOPORPHYRIN (TPL) BY OSO<sub>4</sub>-MEDIATED DIHYDROXYLATION, FOLLOWED BY CRO<sub>3</sub> OXIDATION.

**Step 1: Dihydroxylation of *meso*-Tetraphenylporphyrin: *meso*-Tetraphenyl-2,3-*cis*-dihydroxychlorin **2**.**

Prepared according to a literature procedure (Note 1) [6]. To a 500 mL round-bottom flask equipped with a stir bar, *meso*-tetraphenylporphyrin (TPP) (2.20 g, 3.58 mmol) was dissolved in a mixture of CHCl<sub>3</sub> (270 mL, EtOH-stabilized) and freshly distilled pyridine (30 mL). A glass ampoule of 1.0 g of OsO<sub>4</sub> (1.0 g, 3.93 mmol, ~1.1 equiv.) was opened (Note 2) and immediately submerged (cap and body) (Figure S1) into the mixture. The flask was then stoppered, shielded from light with aluminum foil, and stirred at ambient temperature (20°C–24°C). The progress of the reaction was monitored by occasional TLC. Once no further progress was noted (after about 4 days), the solvent was removed on a rotary evaporator as best as possible. The crude osmate ester product was then dissolved in a solution of 10% MeOH/CHCl<sub>3</sub> (~250 mL). The osmate ester was then reductively cleaved by purging with gaseous H<sub>2</sub>S for 5 min (Note 2); the mixture was stirred for an additional 30 min before the majority of the excess H<sub>2</sub>S was purged from the solution by a stream of nitrogen gas through the solution (Note 3). Following the addition of further MeOH (20 mL), the precipitated black OsS was filtered off through a short plug of Celite<sup>®</sup>. The filtrate was evaporated to dryness by a stream of N<sub>2</sub> or rotary evaporation (Note 4). The resulting residue was dissolved in a minimal amount of CHCl<sub>3</sub> and loaded onto a silica gel column (25 × 7 cm) and eluted with CH<sub>2</sub>Cl<sub>2</sub>. The first fraction was starting material TPP (250 mg, 11% recovery). CH<sub>2</sub>Cl<sub>2</sub>/1.5% MeOH then eluted diol chlorin **2**. Slow evaporation from a MeOH/CH<sub>2</sub>Cl<sub>2</sub> mixture provided product **2** as a bright purple crystalline material (1.00 g, 1.40 mmol, 49% yield). R<sub>f</sub> (silica-CH<sub>2</sub>Cl<sub>2</sub>/1.5% MeOH) = 0.68. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>, δ):

8.67 (d,  $^3J = 4.9$  Hz, 1H), 8.51 (s, 1H), 8.36 (d,  $^3J = 4.9$  Hz, 1H), 8.19 (br d,  $^3J = 6.4$  Hz, 2H), 8.12 (d,  $^3J = 6.2$  Hz, 1H), 7.97 (d,  $^3J = 6.1$  Hz, 1H), 7.79–7.73 (m, 6H), 6.40 (s, 1H), 3.15 (s, exchangeable with D<sub>2</sub>O, 1H), –1.75 (s, 1H). <sup>13</sup>C NMR (125 MHz, CDCl<sub>3</sub>, δ) [6]: 73.9, 113.2, 123.1, 124.2, 126.7, 127.5, 127.7, 127.9, 128.1, 132.2, 132.7, 133.9, 134.1, 135.5, 140.6, 141.2, 141.8, 153.2, 161.4 ppm. UV-vis (CH<sub>2</sub>Cl<sub>2</sub>) λ<sub>max</sub> (log ε) 408 (5.27), 518 (4.19), 544 (4.19), 592 (3.85), 644 (4.38) nm. HR-MS (ESI+, 100% CH<sub>3</sub>CN, 30 V cone voltage) [6]: *m/z* = 648.2525 calc'd for C<sub>44</sub>H<sub>32</sub>N<sub>4</sub>O<sub>2</sub> [M]<sup>+</sup>; found 648.2525.

## Notes

1. All the steps except for the solvent removal were performed in a fume hood following usual laboratory safety practices (gloves, eye protection and lab coats).
2. CAUTION: Note the hazard and risk of using OsO<sub>4</sub> and H<sub>2</sub>S. Trap all excess H<sub>2</sub>S (bleach traps, for example).
3. CAUTION: Work in a fume hood and trap all purged H<sub>2</sub>S (e.g., bleach bubbler)! NB: Washing the organic reaction mixture with dilute base solutions to extract the H<sub>2</sub>S tends to form stable emulsions and thus is not a viable alternative for the removal of the excess H<sub>2</sub>S. Alternatively, an aqueous solution of NaHSO<sub>3</sub> can be used to reductively cleave the osmate ester [11], but the reaction is slower and lower yielding, and best suited for the *meso*-pentafluorophenyl derivatives that cannot be treated with H<sub>2</sub>S (the sulfides undergo nucleophilic aromatic substitution reactions with the *p*-fluorine atoms).
4. CAUTION: Work in a fume hood to capture all residual H<sub>2</sub>S!

**Figure S4.** UV-vis spectrum ( $\text{CH}_2\text{Cl}_2$ ) of *meso*-tetraphenyl-2,3-*cis*-dihydroxychlorin **2**.

**Step 2: Synthesis of *meso*-Tetraphenyl-2-oxa-3-oxoporphyrin (TPL) via  $\text{CrO}_3$  Oxidation of Chlorin Diol **2****

Prepared according to a literature procedure (Note 1) [8]. In a 25 mL round-bottom flask equipped with a stir bar and two carbon pellets, *meso*-tetraphenyl-2,3-*cis*-dihydroxychlorin **2** (100 mg, 0.154 mmol) was dissolved in pyridine (5 mL). Chromium trioxide  $\text{CrO}_3$  (~10 equiv., 154 mg, 1.54 mmol) was added to the solution. The round-bottom flask was shielded from light with aluminum foil, and stirred at ambient temperature (Figure S5). The disappearance of the starting material and the appearance of the product were monitored by TLC. Once no further progress of the reaction was detectable (after ~30 min),  $\text{CH}_2\text{Cl}_2$  (25 mL) was added and the mixture was transferred into a 125 mL separatory funnel and washed with water ( $3 \times 25$  ml). The organic phase was separated and filtered through a short plug of diatomaceous earth (Celite<sup>®</sup>)

and dried over anhyd. Na<sub>2</sub>SO<sub>4</sub>. The drying agent was removed by gravity filtration and the filtrate was evaporated to dryness by rotary evaporation. A gentle stream of N<sub>2</sub> passed through the crude material for several h ensured that the crude material was thoroughly dried. The crude material was dissolved in a few mL CH<sub>2</sub>Cl<sub>2</sub> coated onto silica. The material was then dry-loaded onto a flash column (~6 × 25 cm) silica–CH<sub>2</sub>Cl<sub>2</sub>) and chromatographed to provide TPL in 40–60% yield (60 mg) as a pinkish red solid (Figure S6). *R<sub>f</sub>*(silica–CH<sub>2</sub>Cl<sub>2</sub>) = 0.67. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>, δ): 8.82 (dd, <sup>3</sup>*J* = 4.8, <sup>4</sup>*J* = 1.8 Hz, 1H), 8.79 (dd, <sup>3</sup>*J* = 4.8, <sup>4</sup>*J* = 1.8 Hz, 1H), 8.73 (dd, <sup>3</sup>*J* = 4.8, <sup>4</sup>*J* = 1.8 Hz, 1H), 8.62 (d, <sup>3</sup>*J* = 4.4 Hz, 1H), 8.60 (dd, <sup>3</sup>*J* = 4.4, <sup>4</sup>*J* = 1.8 Hz, 1H), 8.56 (d, <sup>3</sup>*J* = 4.6 Hz, 1H), 8.17–8.12 (m, 6H), 8.02–7.99 (m, 2H), 7.80–7.74 (m, 12H), –1.62 (s, 1H), –2.00 (s, 1H). <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>, δ) [7]: 170.2, 155.2, 154.9, 154.7, 141.4, 140.8, 137.6, 137.4, 137.0, 136.7, 135.4, 134.7, 134.6, 132.9, 131.8, 131.1, 129.9, 129.0, 128.4, 128.3, 128.25, 127.5, 127.3, 126.35, 124.3, 107.0, 102.6, 101.1 ppm. ## PREPARATION OF METALLOPORPHOLACTONE TPLZn AND TPLPt VIA METAL INSERTION.

### [*meso*-Tetraphenyl-2-oxa-3-oxoporphyrinato]zinc(II) (TPLZn)

Prepared as reported in the literature [7]. A 250 ml round-bottom flask was equipped with a stir bar, heating mantle, and a reflux condenser. The flask was charged with porpholactone TPL (123 mg, 1.94 mmol) and Zn(OAc)<sub>2</sub>·2H<sub>2</sub>O (123 mg, 0.193 mmol, 3 equiv.) dissolved in CHCl<sub>3</sub>/MeOH (8:1, 80 mL). The reaction mixture was heated to reflux for ~2 h. Upon completion of reaction as observed by TLC, the reaction mixture was cooled to room temperature and filtered through Celite<sup>®</sup>. The filtrate was concentrated, the concentrate was loaded onto the silica gel column, and purified by short column chromatography (silica, CH<sub>2</sub>Cl<sub>2</sub>) to produce TPLZn as a purple-colored film. Recrystallization by dissolution in a few mL of CH<sub>2</sub>Cl<sub>2</sub>, addition of ~50% MeOH, and slow removal of the CH<sub>2</sub>Cl<sub>2</sub> on a rotary evaporator (at ambient T) precipitated TPLZn; it was retrieved by filtration and air-dried to provide TPLZn as a bright purple crystalline solid in 97% yield (130 mg, 0.143 mmol). *R<sub>f</sub>* (silica–CH<sub>2</sub>Cl<sub>2</sub>) = 0.44. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>, δ): 8.79 (d, <sup>3</sup>*J* = 4.8 Hz, 1H), 8.74–8.71 (m, 3H), 8.64 (d, <sup>3</sup>*J* = 4.6 Hz, 1H), 8.55 (d, <sup>3</sup>*J* = 4.6 Hz, 1H), 8.13 (m, 4H), 8.09 (dd, <sup>3</sup>*J* = 7.7, <sup>4</sup>*J* = 1.6 Hz, 2H), 7.97 (dd, <sup>3</sup>*J* = 7.5, <sup>4</sup>*J* = 1.6 Hz, 2H), 7.79–7.72 (m, 12H). <sup>13</sup>C NMR (75 MHz, CDCl<sub>3</sub>, δ) [7]: 173.5, 154.1, 143.4, 142.1, 142.0, 139.0, 138.0, 134.3, 134.0, 133.8, 132.4, 132.3, 132.2, 132.0, 130.9, 130.7, 130.6, 129.5, 128.8, 127.9, 127.8, 127.7, 127.6, 127.5, 126.7, 126.6. UV-vis (CH<sub>2</sub>Cl<sub>2</sub>) λ<sub>max</sub> (log ε): 402 (sh), 422 (5.53), 520 (3.54), 558 (4.07), 602 (4.44) nm. HR-MS (DART+, orifice voltage = 30 V, 100% CH<sub>3</sub>CN, TOF) [7]: *m/z* = 695.1425 calc'd for C<sub>43</sub>H<sub>27</sub>N<sub>4</sub>O<sub>2</sub><sup>64</sup>Zn [MH]<sup>+</sup>; found 695.1429.

**Note:** All the steps except for the solvent removal were performed in a fume hood following usual laboratory safety practices (gloves, eye protection and lab coats).

## Synthesis of [*meso*-Tetraphenyl-2-oxa-3-oxoporphyrinato]Pt(II) (TPLPt).

Prepared as reported in the literature [7]. A 50 ml round-bottom flask was equipped with a stir bar, heating mantle, a reflux condenser and a N<sub>2</sub> inlet. TPL (65.0 mg, 0.086 mmol) was dissolved in benzonitrile PhCN (5 mL) and added to a refluxing solution of benzonitrile PhCN (20 mL) and PtCl<sub>2</sub> (61 mg, 0.344 mmol, 4 equiv.). The mixture was heated to reflux for 3 h. When the starting material was consumed (reaction monitored by TLC), the reaction mixture was allowed to cool and was evaporated to dryness by rotary evaporation. The resulting mixture was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (2–5ml), loaded as solution onto a flash column (silica-CH<sub>2</sub>Cl<sub>2</sub>) and chromatographed. TPLPt was isolated in 71% (50 mg) yield as a magenta powder. *R<sub>f</sub>* (silica-CH<sub>2</sub>Cl<sub>2</sub>) = 0.17. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>, δ): 8.67 (d, <sup>3</sup>*J* = 5.0 Hz, 1H), 8.65–8.62 (m, 4H), 8.51 (d, <sup>3</sup>*J* = 5.0 Hz, 1H), 8.11–8.05 (m, 6H), 7.96 (dd, <sup>3</sup>*J* = 7.6, <sup>4</sup>*J* = 1.6 Hz, 2H), 7.79–7.72 (m, 12H). <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>, δ) [10]: 164.7, 148.2, 145.8, 142.9, 140.9, 140.5, 140.4, 139.0, 138.9, 138.3, 137.6, 136.5, 133.6 (2 overlapping signals), 133.4, 133.3, 132.1, 131.1, 130.1, 129.6, 129.3, 128.7, 128.4, 128.3 (2 overlapping signals), 128.2, 128.0, 127.8, 127.5, 127.1 (2 overlapping signals), 124.1, 122.1, 116.6, 102.9 ppm. UV–vis (CH<sub>2</sub>Cl<sub>2</sub>) λ<sub>max</sub> (log ε): 421 (5.14), 527 (4.07), 568 (4.49) nm. HR-MS (ESI+, orifice voltage = 30 V, 100% CH<sub>3</sub>CN, TOF) [7]: *m/z* = 826.1782 calc'd for C<sub>43</sub>H<sub>27</sub>N<sub>4</sub>O<sub>2</sub>Pt [MH]<sup>+</sup>; found 826.1802.

**Note:** All the steps except for the solvent removal were performed in a fume hood following usual laboratory safety practices (gloves, eye protection and lab coats).

**Figure S11.**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ) spectrum of TPLPt.

**ONE-STEP SYNTHESIS OF *MESO*-TETRAKIS(PENTAFLUOROPHENYL)-2-OXA-3-OXOPORPHYRIN T<sup>F</sup>PL BY RuCl<sub>3</sub>/OXONE<sup>®</sup> MEDIATED OXIDATION. GENERAL PROCEDURE.**

Prepared according to a modified procedure reported in literature (Note 1) [9]. In a 750 ml round-bottom (or a two neck round-bottom) flask equipped with a stir bar and reflux condenser, T<sup>F</sup>PP (0.8 g, 0.8 mmol, 1 equiv.) and RuCl<sub>3</sub> (85 mg, 0.4 mmol, 0.5 equiv.) were dissolved in 1,2-dichloroethane (ClCH<sub>2</sub>CH<sub>2</sub>Cl, 250 mL) (Note 2). A solution containing 2,2'-bipyridine (65 mg, 0.4 mmol, 0.5 equiv.) in ClCH<sub>2</sub>CH<sub>2</sub>Cl (7 mL) and water (250 mL) were added. A condenser was attached to one of the necks and the solution was heated to reflux (Figure S13). A mixture of Oxone<sup>®</sup> (7.4 g, 12 mmol, 15 equiv.) and NaOH (480 mg, 12 mmol, 15 equiv.) in water (15 mL) was added periodically in five equal portions over the course of 5 h to the refluxing solution. After completion of the addition, the reaction mixture was refluxed overnight. The mixture was allowed to cool to room temperature, quenched with a saturated aqueous solution of Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> (2.0 g in 5 mL of water). The reaction mixture was stirred, allowed to stand for 30 min, and transferred to a 750 mL separatory funnel (Figure S14). The (bottom) organic layer was separated, and the aqueous layer was extracted twice using CH<sub>2</sub>Cl<sub>2</sub> (2 × 150 mL). The combined organic fractions were washed with a saturated aqueous NaCl solution (2 × 150 mL). The organic layer was dried with anhydrous Na<sub>2</sub>SO<sub>4</sub> (30 min) and the drying agent was removed by gravity filtering. The filtrate was reduced to dryness using rotary evaporation (in a 500 mL round-bottom flask). The residue was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (2–5 ml), loaded as a solution onto a packed column (silica, 5 × 60 cm, with a fritted disk, eluent: CH<sub>2</sub>Cl<sub>2</sub>/hexanes = 2:1) and separated to obtain the product T<sup>F</sup>PL as a purple solid upon solvent removal in 30% yield (240 mg, 0.24 mmol). *R<sub>f</sub>* (silica–CH<sub>2</sub>Cl<sub>2</sub>/20% hexane) = 0.68. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>, δ):

8.95 (d,  $^3J = 5.4$  Hz, 1H), 8.91–8.87 (two overlapping d, 2H), 8.85 (d,  $^3J = 5.4$  Hz, 1H), 8.69 (d,  $^3J = 4.7$  Hz, 1H), 8.62 (d,  $^3J = 4.7$  Hz, 1H), -1.76 (s, 1H), -2.06 (s, 1H).  $^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ ,  $\delta$ ) [11]: 165.8, 157.1, 154.7, 154.5, 141.2, 138.8, 138.5, 136.4, 135.3, 133.8, 131.8, 130.0, 127.9, 127.8, 126.0, 108.9, 105.3, 102.6, 87.4 ppm; all *meso*-aryl carbon atoms are broadened, often beyond distinction, because of F-C couplings.  $^{19}\text{F}$  NMR (376 MHz,  $\text{CDCl}_3$ ,  $\delta$ ): -136.70 (m, 4F), -137.03 (dd,  $^3J = 22.7$ ,  $^4J = 7.1$  Hz, 2F), -138.49 (dd,  $^3J = 23.0$ ,  $^4J = 7.4$  Hz, 2F), -150.38 to -150.58 (m, 3F), -151.20 (t,  $^3J = 21.0$  Hz, 1F), -160.78 (m, 6F), -161.42 (td,  $^3J = 22.0$ ,  $^4J = 6.8$  Hz, 2F). UV-vis ( $\text{CH}_2\text{Cl}_2$ )  $\lambda_{\text{max}}$  (log  $\epsilon$ ): 409 (5.18), 510 (3.95), 545 (3.81), 589 (3.60), 642 (4.03) nm. HR-MS (ESI+, 100%  $\text{CH}_3\text{CN}$ , TOF) [9]:  $m/z = 993.0402$  calc'd. for  $\text{C}_{43}\text{H}_9\text{F}_{20}\text{N}_4\text{O}_2$   $[\text{MH}]^+$ ; found 993.0400.

#### Notes:

1. All the steps except for the solvent removal were performed in a fume hood following usual laboratory safety practices (gloves, eye protection and lab coats).
2. The organic solvent used in biphasic reaction mixture, 1,2-dichloroethane is highly toxic and considered as a potential carcinogen. Protective eye wear, gloves, lab coats and masks are required when handling.

## Synthesis of [*meso*-Tetrakis(pentafluorophenyl)-2-oxa-3-oxoporphyrinato]platinum(II) (T<sup>F</sup>PLPt)

Prepared in 50% yield (191 mg) as a reddish powder according to the general procedure described for T<sup>F</sup>Pt synthesis using T<sup>F</sup>PPt (100 mg, 0.16 mmol, 1 equiv.) and RuCl<sub>3</sub> (16.6 mg, 0.08 mmol, 0.5 equiv.) in ClCH<sub>2</sub>CH<sub>2</sub>Cl (50 mL) and water (50 mL) in a 250 mL round bottom flask, mixed with a solution of 2,2'-bipyridine (12.5 mg, 0.08 mmol, 0.5 equiv.) in ClCH<sub>2</sub>CH<sub>2</sub>Cl (1.5 mL). A mixture of Oxone<sup>®</sup> (243.5 mg, 1.6 mmol, 10 equiv.) and NaOH (64.0 mg, 1.6 mmol, 10 equiv.) in water (5 mL) was added in five portions over 5 h while the solution was refluxed for 8 h. Work up and isolation of product were carried out according to the general procedure. *R<sub>f</sub>* (silica-CH<sub>2</sub>Cl<sub>2</sub>/20% hexanes) = 0.52. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>, δ): 8.68–8.83 (m, 6H) ppm. <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>, D1 = 2.5 s, δ) [11]: 163.2, 148.7, 146.7, 142.7, 141.0, 139.9, 139.3, 138.7, 133.9, 131.6, 130.3, 130.0, 129.9, 129.0, 118.7, 112.0, 108.4, 105.9, 88.0; all *meso*-aryl carbon atoms are broadened, often beyond distinction, because of F-C couplings. <sup>19</sup>F NMR (376 MHz, CDCl<sub>3</sub>, δ): -136.49 to -136.76 (m, 6F), -138.19 (dd, <sup>3</sup>*J* = 22.8, <sup>4</sup>*J* = 7.2 Hz, 2F), -150.11 to -150.31 (m, 3F), -150.89 (t, <sup>3</sup>*J* = 20.9 Hz, 1F), -160.38 to -160.67 (m, 6F), -161.25 (td, <sup>3</sup>*J* = 21.4, <sup>4</sup>*J* = 6.3 Hz, 2F). HR-MS (ESI+, 100% CH<sub>3</sub>CN, TOF) [9]: *m/z* = 1184.9819 calc'd. for C<sub>43</sub>H<sub>6</sub>F<sub>20</sub>N<sub>4</sub>O<sub>2</sub>Pt [M]<sup>+</sup>; found 1184.9817.
