

Table S1. List of the 165 metabolites identified and quantified by the SYNHMET approach. Correlation information includes the number of points, the chemical shift used for NMR spectrum profiling, the identified HRMS hit, chromatographic mode and retention time, the measured molecular weight, and the correlation coefficient. For each of the three groups of subjects, the average, minimum, and maximum values are shown, together with the normal range estimated from the HMDB database.

Compound	δ [ppm]	Chromatographic peak(s) (rt[min])	MW	R ²	Metabolite concentration [μ M/mM of Creatinine]				Biochemical classification
					Control (n = 9)	Chronic Cystitis (n = 6)	Bladder Cancer (n = 31)	Normal Range ^a	
1,3-Dimethylurate	3.3 3.4	RP+/- (6.64) HC+/- (2.20)	196.0593	0.9932	1.2 (0.4–2.7)	1.8 (0.3–5.0)	1.9 (0.01–9.0)	≤8	Xanthine Metabolism

Table S2. Comparison of the retention times observed for nine labeled standards (Std) with those assigned with the NMR–HRMS intensity correlation method (Corr) in the two chromatographic conditions.

Metabolite	RP		HC	
	Std rt [min]	Corr rt [min]	Std rt [min]	Corr rt [min]
Carnitine	0.88	0.88	8.02	8.02
Glucose			2.13	2.14
Hypoxanthine			2.35	2.36
Inosine			2.37	2.37
Kynurenate			3.60	3.56
Kynurenine			5.19	5.14
Lactate	1.57	1.57		
Tryptophan			5.09	5.08
Tyrosine	2.05	2.05	5.38	5.38

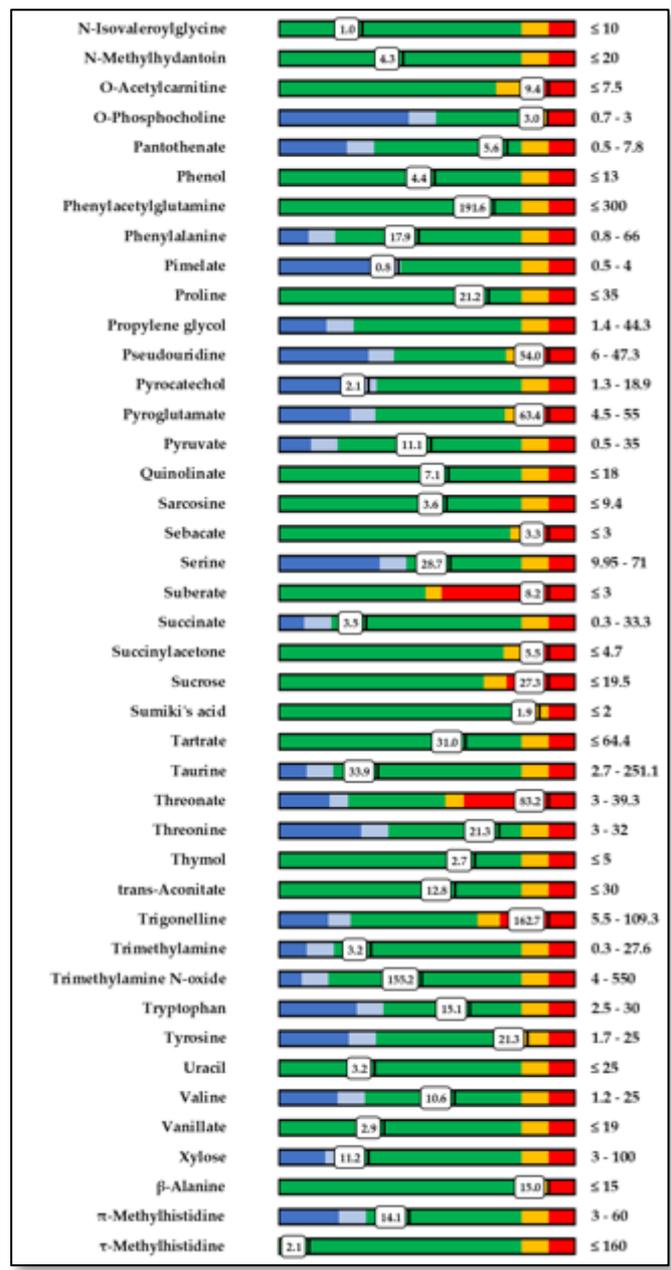

Figure S1. Personalized metabolic profile of a BC patient showing all 165 metabolites identified and quantified by SYNHMET. Right values represent literature ranges for adults over 18 years old. Values within the blue and red areas represent lower and higher values. All metabolite values and ranges are reported as μM , except for Creatinine g/L.
