Abstract: The development of new and greener approaches to organic synthesis has been a trend in recent years. Continuing the latest publications of our team, in this work, we demonstrate the efficiency of three solvents: eucalyptol (1,8-cineole), cyclopentyl methyl ether (CPME), and 2-methyltetrahydrofuran (2-MeTHF) for the synthesis of O,S,N-heterocyclic compounds.

Keywords: eucalyptol; cyclopentyl methyl ether; 2-methyltetrahydrofuran; O,S,N-heterocycles; greener methodology; green solvent

1. Introduction

The main goal of this work was to demonstrate the efficiency of new solvents as alternatives for the synthesis of O,S,N-heterocyclic compounds. In organic synthesis, the solvent is the component present in the greatest amount and is the basic element of the environmental performance of a process [1–3]. The search for alternative solvents with a lower environmental impact has increased in recent years, with several articles describing green solvents as effective alternatives to conventional petroleum solvents [4–9]. In our recent work, we have endeavored to show that eucalyptol could be an extremely interesting alternative as a solvent for various chemical transformations. Its use is all the more interesting as it contributes to the recycling of waste produced by the wood and paper industries. Eucalyptol is extracted from eucalyptus leaves, which are increasingly cultivated due to their rapid growth. Therefore it seemed relevant to compare it to other ether-type solvents deemed to be green. In order to continue to develop new and green methods to construct heterocyclic rings containing oxygen, sulfur, and nitrogen [10–14], we report here the use of eucalyptol (1,8-cineole), cyclopentyl methyl ether (CPME), and 2-methyltetrahydrofuran (2-MeTHF) as alternative solvents for metal-free click chemistry and Buchwald–Hartwig coupling (Figure 1). 2-methyltetrahydrofuran (2-MeTHF) is already well known to generate fewer peroxides than when tetrahydrofuran (THF) is obtained from renewable corn cobs and bagasse resources. Cyclopentyl methyl ether (CPME) was also described to be a good alternative, more stable than THF and 2-MeTHF, and it has improved laboratory safety, minimizing the formation of peroxides.

Substituted triazole derivatives are an important class of nitrogen-fused heterocycles, which are abundant in many pharmaceutical compounds. Over the past decades, the Food and Drug Administration (FDA) has increasingly approved drugs with these skeletons for their important biological activities (Figure 2) [15,16].

Figure 1. Green solvents used in this work.

Figure 2. Structures of some Food and Drug Administration (FDA) approved drugs with heterocyclic scaffolds reported in this study.

To the best of our knowledge, there is no report in the literature to date on the use of eucalyptol, CPME, and 2-MeTHF to construct O,S,N-heterocycles by metal-free click chemistry. Therefore it seemed relevant to study solvent alternatives for this methodology. A literature review on the Buchwald–Hartwig reaction, carried out by palladium catalysis, revealed two examples of the application of green solvents: CPME (Figure 3a) [17] and eucalyptol (Figure 3b) [10]. The objective of the present study was to further enhance the greener side and try to make its use compatible with microwave-assisted synthesis and, consequently, to reduce the duration of the reaction.

2. Results and Discussion

The study presented herein is divided into three parts, each of them corresponding to a type of reaction developed and evaluated in the different solvents investigated.

2.1. Metal-Free Click Chemistry

This part of the work was based on our previous conditions published in 2017 [18]. The intention was to make the reaction conditions more efficient and sustainable. A one-pot methodology was first successfully developed, using only toluene as solvent. The scope and limitations of the process were then analyzed using several propargyl derivatives. The reaction using toluene as a solvent served as a standard of comparison for the results obtained with the three green solvents. For this evaluation, several heterocyclic compounds containing oxygen, sulfur, and nitrogen were chosen as starting materials. The results obtained are given by the class of heterocycle.

2.1.1. 7-Amino-2,3-dihydro-benzo[1,4]dioxine-6-carboxylic Acid Methyl ester

The commercially available 7-amino-2,3-dihydro-benzo[1,4]dioxine-6-carboxylic acid methyl ester (**1a**) was reacted first with *t*BuONO and TMSN₃ for 1 h, and then stirred with several propargyl derivatives in toluene without the use of any metal catalyst (Figure 4).

The new compounds **2a–d** were obtained in moderate to good yields. We focused on product **2a**, obtained from propargyl bromide because it can be functionalized at a later stage, which makes it possible to increase molecular diversity. Therefore, the next step was to test the yield of compound **2a** using these reaction conditions in the three green solvents selected (Table 1).

Compound **2a** was successfully obtained in the three experiments carried out in CPME, 2-MeTHF, and eucalyptol (Table 1) instead of toluene. The highest yield was obtained with 2-MeTHF (Table 1, Entry 2). Moreover, the yield increased from 57% with toluene to 70% when using a green solvent.

2.1.2. Methyl 6-amino-1*H*-indazole-7-carboxylate

The commercially available methyl 6-amino-1*H*-indazole-7-carboxylate (**1b**) was submitted to the same conditions as 7-amino-2,3-dihydro-benzo[1,4]dioxine-6-carboxylic acid

methyl ester (**1a**). In this case, also, we were able to synthesize the desired new compounds **3a–d** in moderate to good yields in toluene (Figure 5).

With this heterocycle derived from indazole, obtaining the brominated compound using CPME, 2-MeTHF and eucalyptol were only achieved with very average yields (Table 2, Entries 1–3). However, these results, although disappointing, were envisaged because the synthesis yield of this brominated derivative under conventional solvent (toluene) conditions was already low (48%) and not very far from that obtained with 2-MeTHF, or even with eucalyptol. 2-MeTHF was, in this case, also the solvent that achieved the best result (Tables 1 and 2, Entry 2).

2.1.3. Methyl 3-amino-5-phenylthiophene-2-carboxylate

The commercially available methyl 3-amino-5-phenylthiophene-2-carboxylate (**1c**) underwent the same metal-free click chemistry under the same conditions in the presence of various propargyl derivatives, leading to the expected compounds in very good yields (Figure 6).

**Figure 6.** Study of scope and limitations of Metal-free Click Chemistry from methyl 3-amino-5-phenylthiophene-2-carboxylate.

With the same objective as in the previous series, the functionalizable brominated compound **4a** was synthesized in the three solvents. The results obtained were excellent, and in all green solvents, the yield was higher than that obtained with toluene as solvent (Table 3, Entries 1–3).

Table 3. Synthesis of **4a** using several green solvents.

2	2-MeTHF	89
3	Eucalyptol	87
4 ^b	CPME	28

^a Isolated yield after purification by flash chromatography. ^b Microwave, 140 °C, 1 h.

In view of the good results obtained from methyl 3-amino-5-phenylthiophene-2-carboxylate (**1c**) as starting material, we decided to use the green solvent that performed best (i.e., CPME) to test a microwave-assisted methodology. In the first stage of the one-pot process, the same reaction conditions were used since the reaction was easily carried out in 1 h at room temperature. Then, for the second step, the reaction was stirred for 1 h under microwave irradiation at 140 °C in a Biotage microwave apparatus. The result obtained using CPME as solvent did not allow us to carry out the reaction efficiently under microwave irradiation (Table 3, Entry 4).

2.1.4. Methyl 3-aminothiophene-2-carboxylate

Starting from commercially available methyl 3-aminothiophene-2-carboxylate (**1d**), we obtained the same results, and the desired compounds were synthesized in good to excellent yields (Figure 7).

Figure 7. Study of scope and limitations of Metal-free Click Chemistry from methyl 3-aminothiophene-2-carboxylate.

As in the other series, the brominated product **5a** was tested using the three green solvents (Table 4, Entries 1–3). The highest yield was obtained with eucalyptol for this starting material. It gave an excellent result, higher than that presented by toluene. For this reason, we also tested a microwave-assisted methodology in eucalyptol, but again, the yield decreased considerably when, in step two of the one-pot process, the reaction was placed in the microwave at 140 °C for 1 h. The use of microwave irradiation did not seem effective under these conditions (Table 4, Entry 4).

2.1.5. Methyl 4-amino-5-thiazolecarboxylate

The commercially available methyl 4-amino-5-thiazolecarboxylate (**1e**) was submitted to the same protocol as the other classes of heterocycles in toluene (Figure 8). The reactivity of methyl 4-amino-5-thiazolecarboxylate (**1e**) was found to be lower than that of the other classes of heterocycles tested (Figure 8). One reason may be the lower solubility of the compound in the medium since even when the medium was diluted, no complete dissolution was ever observed.

Figure 8. Study of scope and limitations of Metal-free Click Chemistry from methyl 4-amino-5-thiazolecarboxylate.

Although the yield of the brominated compound **6a** in this series was only 38%, the same tests using the different solvents were carried out (Table 5).

Table 5. Synthesis of **6a** using several green solvents.

6a

Entry	Solvent	Yield ^a (%)
1	CPME	29
2	2-MeTHF	12
3	Eucalyptol	18

^a Isolated yield after purification by flash chromatography.

Compound **6a** was obtained with the three solvents, but as expected, the yields were very low when compared to the other series of heterocycles performed earlier in this study (Table 5). In this case, the best yield was obtained with CPME.

To optimize conditions for the synthesis of heterocycles in green solvents using microwave irradiation as an activation method, we decided to use the conditions previously published by our team [10] for the synthesis of 10*H*-pyrido[1,2-*a*]thieno[3,2-*d*]pyrimidin-10-one.

2.2. Buchwald-Hartwig Coupling/Pyridine Dearomatization Sequence

The purpose was to accomplish a microwave-assisted synthesis using green solvents to obtain 10*H*-pyrido[1,2-*a*]thieno[3,2-*d*]pyrimidin-10-one derivatives. For this examination, the prior methyl 3-aminothiophene-2-carboxylate (**1d**) and 3-amino-5-phenylthiophene-2-carboxylate (**1c**) were used as starting material. As demonstrated in [10], we knew that the results obtained in Microwave with eucalyptol were unsatisfactory, so we only tested toluene, CPME, and 2-MeTHF. In order to have standard results to serve as a reference for green solvents, the products were synthesized using eucalyptol (Figures 9 and 10).

Starting from methyl 3-aminothiophene-2-carboxylate (**1d**) or methyl 3-amino-5-phenylthiophene-2-carboxylate (**1c**), eight new compounds were obtained in acceptable yields (Figures 9 and 10).

As explained earlier, the objective in this section was to find a methodology that combined the use of a green solvent with the use of microwave irradiation. For this optimization process (Table 6), we chose compound **8a** as it showed the highest yield when obtained through classical heating with eucalyptol as an alternative solvent.

Figure 9. Study of scope and limitations of Buchwald–Hartwig Coupling/Pyridine Dearomatization Sequence from methyl 3-aminothiophene-2-carboxylate **1d**.

8	2-MeTHF	140	2	3/4	MW	65
9	CPME	160	1	3/4	MW	71
10	2-MeTHF	160	1	3/4	MW	64

^a Isolated yield after purification by flash chromatography.

The optimization protocol started by using the same reaction conditions (Figure 8), changing only the solvent of the reaction mixture (Table 6, Entries 1–3). The desired product was obtained in good yield. Changing the solvent did not interfere with the reaction performance, and using 2-MeTHF led to a better yield than with eucalyptol (Figure 9; Table 6, Entry 2). Tests were next performed to estimate the compatibility of the two green solvents (CPME and 2-MeTHF) in a microwave-assisted reaction (Table 6, Entries 4 and 5). Toluene was used as a reference for a conventional solvent (Table 6, Entry 6). From methyl 3-aminothiophene-2-carboxylate using Pd(OAc)₂ (3mol%), Xantphos (4 mol%), and Cs₂CO₃ (2.5 equiv) at 140 °C for 1 h under microwave irradiation, the product was obtained in all solvents (Table 6, Entries 4–6). However, yields were slightly lower than reactions stirred in a classical heating system (Table 6, Entries 1–6). It should be noted that the reaction with CPME and 2-MeTHF was not complete, unlike that observed in toluene, which may explain this drop in yield (Table 6, Entries 4 and 5). To check this and try to complete the reactions in green solvents, the microwave irradiation was increased to 2 h (Table 6, Entries 7 and 8). With a longer reaction time, the conversion was total (no traces of starting materials), but there were signs of degradation. After purification of the desired product, the yields remained unchanged (Table 6, Entries 4–5 and 7–8). As the increase

in the reaction time did not allow a significant improvement, we kept the initial reaction time to limit possible degradation of the medium while increasing the temperature of the reaction to 160 °C so as to enhance the reaction speed. The results were satisfactory (Table 6, Entries 9 and 10). CPME showed an improved yield (Table 6, Entry 9) with 1 h of microwave irradiation at 160 °C. With 2-MeTHF, the yield obtained was similar (Table 6, Entry 10) but in a shorter reaction time at 160° compared to 140 °C, where the reaction was not complete.

With this optimization study (Table 6), we can conclude that CPME and 2-MeTHF are valid options for this reaction and allow a significant reduction in the reaction time, even if it is at the expense of a slight decrease in the yield of the desired final product.

The same optimization process was used from 3-amino-5-phenylthiophene-2-carboxylate (**1c**) under the same reaction conditions (Figure 10), just changing the solvent of the reaction mixture. The desired product was obtained in good to excellent yields (Table 7, Entries 1–3). The change of solvent improved the yield, and for all tests, the results were higher than those obtained with eucalyptol (Figure 10; Table 7, Entries 1–3). After performing the method with classical heating, we tested for each solvent the best conditions found in the study carried out from 3-aminothiophene-2-carboxylate (Table 6, Entries 6, 8 and 9).

Table 7. Synthesis of **9a** varying the solvent and heating system.

Entry	Solvent	T (°C)	t (h)	Catalyst% Pd(OAc) ₂ /Xantphos	Heating System	Yield ^a (%)
1	CPME	120	overnight	3/4	Classical	96
2	2-MeTHF	120	overnight	3/4	Classical	86
3	Toluene	120	overnight	3/4	Classical	86
4	Toluene	140	1	3/4	MW	39
5	Toluene	140	2	3/4	MW	43
6	2-MeTHF	140	2	3/4	MW	19
7	2-MeTHF	140	4	3/4	MW	35
8	CPME	160	1	3/4	MW	53
9	CPME	160	2	3/4	MW	87

^a Isolated yield after purification by flash chromatography.

The desired product **9a** was obtained, but the reaction was not complete; the presence of starting product was still observed (Table 7, Entries 4, 6, and 8). Under microwave irradiation, for the three solvents, it was necessary to double the reaction time to obtain a total conversion (Table 7, Entries 5, 7, and 9). In this case, among all the solvents tested in the reaction involving 3-amino-5-phenylthiophene-2-carboxylate, CPME showed by far the highest yields in both heating systems (Table 7, Entries 1 and 9).

2.3. Buchwald–Hartwig Amination of Bromo Derivatives (2–6a)

In the last part of our study, the proposed objective was to functionalize the brominated products synthesized previously. For this purpose, the reaction was first optimized using the compound **4a** and aniline. The choice of the catalytic system, base, and temperature was based on our previous work [12]. Once again, toluene was used as a conventional solvent reference (Table 8, Entry 1).

Table 8. Synthesis optimization of **11a** by varying the solvent, base, and heating system.

Entry	Solvent	T (°C)	t	Catalyst% Pd(OAc) ₂ /BINAP	Base	Yield ^a (%)
1	Toluene	110	22 h	5/10	Cs ₂ CO ₃	45
2	DMF	r.t	17 h	5/10	K ₂ CO ₃	84
3	DMF	r.t	17 h	5/10	Cs ₂ CO ₃	54
4	Toluene	r.t	18 h	5/10	K ₂ CO ₃	76
5	2-MeTHF	r.t	5 days	5/10	K ₂ CO ₃	46
6	CPME	r.t	3 days	5/10	K ₂ CO ₃	70
7	CPME ^b	110	1 h	5/10	K ₂ CO ₃	84

^a Isolated yield after purification by flash chromatography. ^b MW. BINAP: (±)-BINAP, 2,2'-Bis(diphenylphosphino)-1,1'-binaphthalene; DMF: *N,N*-Dimethylformamide.

The desired product **11a** was obtained, but the yield was below expectations (Table 8, Entry 1). A brief literature review showed that in some cases, it might be beneficial to carry out the reaction at room temperature [19,20]. To test the effectiveness of this aspect and to be able to apply it in our study, the reaction was launched with the solvent commonly used in these cases, *N,N*-dimethylformamide. The base selected was K₂CO₃, reported to be the right choice in these reaction systems [19]. After these changes in the reaction conditions, the yield improved satisfactorily (Table 8, Entry 2). To confirm the influence of the base, a test was performed replacing K₂CO₃ with Cs₂CO₃ (Table 8, Entry 3). The yield decreased, so K₂CO₃ was kept as the base. Finally and after having all the conditions in hand, we proceeded to determine the performance of the three solvents. The product was obtained in good yield in toluene and CPME (Table 8, Entries 4 and 6). The reaction stirred in 2-MeTHF led to the lowest yield and the longest reaction time, five days (Table 8, Entry 6). CPME was therefore chosen for the tests under MW. The aim was to see if it would be possible to significantly reduce the reaction time found in classic heating, i.e., three days. Surprisingly, stirring the reaction mixture for 1 h at 110 °C with microwave irradiation resulted in a complete reaction and consequently a good yield of the desired product (Table 8, Entry 7). The initial goal had been successfully achieved. Based on our results, the scope and limitations of this procedure were assessed using aniline and the brominated compounds synthesized earlier in this study (Figure 11).

Several methyl-[(hetero)aryl-methyl]-1*H*-1,2,3-triazol-1-yl)-(hetero)aryl-carboxylate derivatives (**11–15a** and **11b**) were synthesized in moderate to good yields, demonstrating the generalizability of this method (Figure 11). We also used 4-aminobenzofuran (**10b**) to diversify the type of amine in our series and demonstrate the potential of the methodology.

Figure 11. Study of scope and limitations of Buchwald–Hartwig Coupling.

3. Materials and Methods

3.1. General Methods

All reagents were purchased from commercial suppliers Sigma Aldrich, St Quentin Fallavier CEDEX, France; Fluorochem, Derbyshire, SK131QH, UK, and were used without further purification. The reactions were monitored by thin-layer chromatography (TLC) analysis using silica gel (60 F254) plates. Compounds were visualized by UV irradiation (Merck, St Quentin Fallavier CEDEX, France). Flash column chromatography was performed on silica gel 60 (230–400 mesh, 0.040–0.063 mm). Melting points (mp (°C)) were taken on samples in open capillary tubes and are uncorrected. ¹H- and ¹³C- nuclear magnetic resonance (NMR) spectra were recorded on a Bruker AVANCE II spectrometer (Bruker, Wissembourg, France) at 250 MHz (¹³C, 62.9 MHz) and on a Bruker AVANCE III HD nanobay (Bruker, Wissembourg, France) 400 MHz (¹³C 100.62 MHz). Chemical shifts are given in parts per million from tetramethylsilane (TMS) or deuterated solvent (MeOH-d₄, Chloroform-d) as an internal standard. The following abbreviations are used for the proton spectra multiplicities: b: broad, s: singlet, d: doublet, t: triplet, q: quartet, p: pentuplet, and m: multiplet. Coupling constants (J) are reported in Hertz (Hz). Multiplicities were determined by the DEPT 135 sequence. High-resolution mass spectra (HRMS) were performed on a Maxis UHR-q-TOF mass spectrometer (Bruker, Wissembourg, France) Bruker 4G with an electrospray ionisation (ESI) mode (Bruker, Wissembourg, France).

3.2. General Procedure for the Synthesis of Compounds **2–6a–d**

A solution of methyl anthranilate (50 mg, 1 equiv.) in toluene (50 mL) was cooled to 0 °C, and *t*-BuONO (1.5 equiv.) followed by TMSN₃ (1.5 equiv.) were added dropwise. The resulting solution was stirred at r.t. for 1 h. Then, the respective alkyne derivative (5 equiv.) was added, and the reaction mixture was heated at 90 °C overnight. After completion, the mixture was concentrated under vacuum. The solid obtained was purified by flash

chromatography. The solvent polarity was increased via a gradient from neat petroleum ether to a mixture of ethyl acetate/petroleum ether (Supplementary Materials).

Methyl 7-(5-(bromomethyl)-1H-1,2,3-triazol-1-yl)-2,3-dihydrobenzo[b][1,4]dioxine-6-carboxylate 2a: white solid (48 mg, 57%), m.p. 133–135 °C. ¹H-NMR (400 MHz, CDCl₃) δ 3.65 (s, 3H), 4.32–4.35 (m, 4H), 4.65 (s, 2H), 6.97 (s, 1H), 7.57 (s, 1H), 7.77 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 21.7 (CH), 52.4 (CH), 64.3 (CH), 64.7 (CH), 116.8 (CH), 120.1 (C), 120.6 (CH), 125.5 (CH), 130.1 (C), 143.9 (C), 144.5 (C), 146.9 (C), and 164.5 (C) ppm. HRMS: calculated (calcd) for C₁₃H₁₃BrN₃O₄ [M + H]⁺ 354.0084, found 354.0082.

Methyl 7-(5-(hydroxymethyl)-1H-1,2,3-triazol-1-yl)-2,3-dihydrobenzo[b][1,4]dioxine-6-carboxylate 2b: white solid (61 mg, 88%), m.p. 204–206 °C. ¹H-NMR (400 MHz, CDCl₃) δ 7.73 (s, 1H), 3.64 (s, 3H), 4.33 (s, 4H), 4.85 (s, 2H), 6.93 (d, J = 10.7 Hz, 1H), 7.57 (d, J = 9.2 Hz, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 52.4 (CH), 56.4 (CH), 64.3 (CH), 64.7 (CH), 116.7 (CH), 120.0 (C), 120.4 (CH), 124.3 (CH), 130.5 (C), 144.3 (C), 146.8 (C), 147.1 (C), and 164.6 (C) ppm. HRMS: calcd for C₁₃H₁₄N₃O₅ [M + H]⁺ 292.0928, found 292.0933.

Methyl 7-(5-(acetoxymethyl)-1H-1,2,3-triazol-1-yl)-2,3-dihydrobenzo[b][1,4]dioxine-6-carboxylate 2c: white solid (41 mg, 51%), m.p. 141–143 °C. ¹H-NMR (400 MHz, CDCl₃) δ 2.08 (s, 3H), 3.64 (s, 3H), 4.33 (s, 4H), 5.27 (s, 2H), 6.96 (s, 1H), 7.57 (s, 1H), 7.79 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 20.9 (CH), 52.3 (CH), 57.6 (CH), 64.3 (CH), 64.7 (CH), 116.8 (CH), 120.0 (C), 120.5 (CH), 126.3 (CH), 130.3 (C), 142.2 (C), 144.4 (C), 146.8 (C), 164.5 (C), and 170.8 (C) ppm. HRMS: calcd for C₁₅H₁₆N₃O₆ [M + H]⁺ 334.1034, found 334.1033.

Methyl 7-(5-((benzyl(methyl)amino)methyl)-1H-1,2,3-triazol-1-yl)-2,3-dihydrobenzo[b][1,4]dioxine-6-carboxylate 2d: yellow oil (47 mg, 50%). ¹H-NMR (400 MHz, CDCl₃) δ 2.29 (s, 3H), 3.60 (s, 2H), 3.62 (s, 3H), 3.80 (s, 2H), 4.31–4.34 (m, 4H), 6.96 (s, 1H), 7.21–7.37 (m, 5H), 7.56 (s, 1H), 7.67 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 42.1 (CH), 52.0 (CH), 52.3 (CH), 61.3 (CH), 64.3 (CH), 64.6 (CH), 116.7 (CH), 120.2 (C), 120.4 (CH), 125.0 (CH), 127.0 (CH), 128.3 (2 × CH), 129.0 (2 × CH), 130.6 (C), 138.8 (C), 144.2 (C), 144.6 (C), 146.7 (C), and 164.7 (C) ppm. HRMS: calcd for C₂₁H₂₃N₄O₄ [M + H]⁺ 395.1714, found 395.1712.

Methyl 6-(5-(bromomethyl)-1H-1,2,3-triazol-1-yl)-1H-indazole-7-carboxylate 3a: white solid (42 mg, 48%), m.p. 287–289 °C. ¹H-NMR (400 MHz, CDCl₃) δ 3.77 (s, 3H), 4.71 (s, 2H), 7.28 (d, J = 8.3 Hz, 1H), 7.88 (s, 1H), 8.10 (d, J = 8.3 Hz, 1H), 8.26 (s, 1H), 11.50 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 21.4 (CH), 52.9 (CH), 109.1 (C), 120.7 (CH), 125.2 (C), 125.5 (CH), 126.5 (CH), 135.4 (CH), 135.6 (C), 139.3 (C), 144.4 (C), and 164.7 (C) ppm. HRMS: calcd for C₁₂H₁₁BrN₅O₂ [M + H]⁺ 336.0091, found 336.0088.

Methyl 6-(5-(hydroxymethyl)-1H-1,2,3-triazol-1-yl)-1H-indazole-7-carboxylate 3b: white solid (55 mg, 77%), m.p. 177–179 °C. ¹H-NMR (400 MHz, CDCl₃) δ 3.80 (d, J = 3.5 Hz, 3H), 7.28 (d, J = 1.8 Hz, 2H), 7.86 (s, 1H), 8.13 (dd, J = 10.8, 8.3 Hz, 1H), 8.29 (d, J = 5.7 Hz, 1H), 11.45 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 21.4 (CH), 52.9 (CH), 109.1 (C), 120.7 (CH), 125.2 (C), 125.5 (CH), 126.5 (CH), 135.4 (CH), 135.6 (C), 139.3 (C), 144.4 (C), and 164.7 (C) ppm. HRMS: calcd for C₁₂H₁₂N₅O₃ [M + H]⁺ 274.0935, found 274.0938.

Methyl 6-(5-(acetoxymethyl)-1H-1,2,3-triazol-1-yl)-1H-indazole-7-carboxylate 3c: white solid (66 mg, 71%), m.p. 132–134 °C. ¹H-NMR (400 MHz, CDCl₃) δ 2.09 (s, 3H), 3.73 (s, 3H), 5.32 (s, 2H), 7.23 (d, J = 8.3 Hz, 1H), 7.91 (s, 1H), 8.05 (d, J = 8.3 Hz, 1H), 8.23 (s, 1H), 11.79 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 20.9 (CH), 52.8 (CH), 57.6 (CH), 120.6 (CH), 109.0 (C), 125.1 (C), 126.4 (CH), 126.4 (CH), 135.3 (CH), 135.7 (C), 139.2 (C), 142.5 (C), 164.7 (C), and 170.9 (C) ppm. HRMS: calcd for C₁₄H₁₄N₅O₄ [M + H]⁺ 316.1040, found 316.1040.

Methyl 6-(5-((benzyl(methyl)amino)methyl)-1H-1,2,3-triazol-1-yl)-1H-indazole-7-carboxylate 3d: yellow oil (64 mg, 65%). ¹H-NMR (400 MHz, CDCl₃) δ 2.35 (s, 3H), 3.66 (s, 2H), 3.74 (s, 3H), 3.89 (s, 2H), 7.27–7.41 (m, 6H), 7.82 (s, 1H), 8.08 (d, J = 8.3 Hz, 1H), 8.27 (s, 1H), 11.78 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 42.2 (CH), 52.0 (CH), 52.8 (CH), 61.3 (CH), 109.0 (C), 120.6 (CH), 125.0 (C), 125.1 (CH), 126.3 (CH), 127.1 (CH), 128.3 (2 × CH), 129.0 (2 × CH),

135.3 (CH), 136.1 (C), 138.7 (C), 139.3 (C), 145.1 (C), and 164.9 (C) ppm. HRMS: calcd for $C_{20}H_{21}N_6O_2$ $[M + H]^+$ 377.1721, found 377.1722.

Methyl 3-(5-(bromomethyl)-1H-1,2,3-triazol-1-yl)-5-phenylthiophene-2-carboxylate 4a: white solid (70mg, 86%), m.p. 138–140 °C. 1H -NMR (400 MHz, $CDCl_3$) δ 3.86 (s, 3H), 4.67 (s, 2H), 7.41–7.46 (m, 3H), 7.64 (dd, $J = 7.7, 1.7$ Hz, 2H), 7.73 (s, 1H), 8.52 (s, 1H) ppm. ^{13}C -NMR (101 MHz, $CDCl_3$) δ 21.5 (CH), 52.7 (CH), 119.6 (C), 121.8 (CH), 125.7 (CH), 126.0 (2 \times CH), 129.3 (2 \times CH), 129.8 (CH), 132.0 (C), 138.4 (C), 143.8 (C), 149.4 (C), and 160.7 (C) ppm. HRMS: calcd for $C_{15}H_{13}BrN_3O_2S$ $[M + H]^+$ 377.9906, found 377.9906.

Methyl 3-(5-(hydroxymethyl)-1H-1,2,3-triazol-1-yl)-5-phenylthiophene-2-carboxylate 4b: white solid (57mg, 84%), m.p. 161–163 °C. 1H -NMR (400 MHz, $CDCl_3$) δ 3.87 (s, 3H), 4.90 (s, 2H), 7.44 (td, $J = 5.5, 2.8$ Hz, 3H), 7.66 (dd, $J = 7.9, 1.6$ Hz, 2H), 7.73 (s, 1H), 8.43 (s, 1H) ppm. ^{13}C -NMR (101 MHz, $CDCl_3$) δ 52.6 (CH), 56.6 (CH), 119.6 (C), 122.0 (CH), 124.6 (CH), 126.1 (2 \times CH), 129.3 (2 \times CH), 129.8 (CH), 132.1 (C), 138.7 (C), 146.8 (C), 149.3 (C), and 160.7 (C) ppm. HRMS: calcd for $C_{15}H_{14}N_3O_3S$ $[M + H]^+$ 316.0750, found 316.0744.

Methyl 3-(5-(acetoxymethyl)-1H-1,2,3-triazol-1-yl)-5-phenylthiophene-2-carboxylate 4c: white solid (67 mg, 88%), m.p. 147–149 °C. 1H -NMR (400 MHz, $CDCl_3$) δ 2.09 (s, 3H), 3.85 (s, 3H), 5.30 (s, 2H), 7.40–7.45 (m, 3H), 7.62–7.65 (m, 2H), 7.70 (s, 1H), 8.49 (s, 1H) ppm. ^{13}C -NMR (101 MHz, $CDCl_3$) δ 20.9 (CH), 52.6 (CH), 57.5 (CH), 119.7 (C), 121.9 (CH), 126.0 (2 \times CH), 126.6 (CH), 129.3 (2 \times CH), 129.8 (CH), 132.0 (C), 138.5 (C), 142.0 (C), 149.3 (C), 160.6 (C), and 170.8 (C) ppm. HRMS: calcd for $C_{17}H_{16}N_3O_4S$ $[M + H]^+$ 358.0856, found 358.0850.

Methyl 3-(5-((benzyl(methyl)amino)methyl)-1H-1,2,3-triazol-1-yl)-5-phenylthiophene-2-carboxylate 4d: yellow oil (68 mg, 76%). 1H -NMR (400 MHz, $CDCl_3$) δ 2.35 (s, 3H), 3.65 (s, 2H), 3.88 (s, 5H), 7.27–7.31 (m, 1H), 7.35 (t, $J = 7.3$ Hz, 2H), 7.45 (ddd, $J = 13.4, 8.7, 6.5$ Hz, 5H), 7.67–7.70 (m, 2H), 7.77 (s, 1H), 8.40 (s, 1H) ppm. ^{13}C -NMR (101 MHz, $CDCl_3$) δ 42.1 (CH), 51.9 (CH), 52.5 (CH), 61.2 (CH), 119.5 (C), 122.0 (CH), 125.6 (CH), 126.1 (2 \times CH), 127.1 (CH), 128.3 (2 \times CH), 129.1 (2 \times CH), 129.3 (2 \times CH), 129.7 (CH), 132.1 (C), 138.8 (C), 138.9 (C), 144.3 (C), 149.2 (C), and 160.7 (C) ppm. HRMS: calcd for $C_{23}H_{23}N_4O_2S$ $[M + H]^+$ 419.1536, found 419.1540.

Methyl 3-(5-(bromomethyl)-1H-1,2,3-triazol-1-yl)thiophene-2-carboxylate 5a: yellow solid (89mg, 92%), m.p. 121–123 °C. 1H -NMR (400 MHz, $CDCl_3$) δ 3.81 (s, 3H), 4.62 (s, 2H), 7.47 (d, $J = 5.4$ Hz, 1H), 7.60 (d, $J = 5.4$ Hz, 1H), 8.42 (s, 1H) ppm. ^{13}C -NMR (101 MHz, $CDCl_3$) δ 21.5 (CH), 52.7 (CH), 122.0 (C), 125.7 (CH), 126.4 (CH), 131.3 (CH), 138.0 (C), 143.7 (C), 160.6 (C) ppm (Chemical Abstracts Service Registry Number: 1203476-09-8).

Methyl 3-(5-(hydroxymethyl)-1H-1,2,3-triazol-1-yl)thiophene-2-carboxylate 5b: white solid (55mg, 72%), m.p. 94–96 °C. 1H -NMR (400 MHz, $CDCl_3$) δ 3.84 (s, 3H), 4.88 (d, $J = 5.0$ Hz, 2H), 7.49 (d, $J = 5.4$ Hz, 1H), 7.61 (d, $J = 5.4$ Hz, 1H), 8.34 (s, 1H) ppm. ^{13}C -NMR (101 MHz, $CDCl_3$) δ 52.6 (CH), 56.4 (CH), 122.0 (C), 124.6 (CH), 126.6 (CH), 131.1 (CH), 138.4 (C), 146.9 (C), and 160.6 (C) ppm (CAS: 1203476-11-2).

Methyl 3-(5-(acetoxymethyl)-1H-1,2,3-triazol-1-yl)thiophene-2-carboxylate 5c: white solid (62 mg, 69%), m.p. 163–165 °C. 1H -NMR (400 MHz, $CDCl_3$) δ 2.06 (s, 3H), 3.82 (s, 3H), 5.26 (s, 2H), 7.47 (d, $J = 5.4$ Hz, 1H), 7.60 (d, $J = 5.4$ Hz, 1H), 8.40 (s, 1H) ppm. ^{13}C -NMR (101 MHz, $CDCl_3$) δ 20.9 (CH), 52.6 (CH), 57.5 (CH), 122.0 (C), 126.5 (CH), 126.6 (CH), 131.2 (CH), 138.1 (C), 142.0 (C), 160.5 (C), and 170.7 (C) ppm. HRMS: calcd for $C_{11}H_{12}N_3O_4S$ $[M + H]^+$ 282.0543, found 282.0540.

Methyl 3-(5-((benzyl(methyl)amino)methyl)-1H-1,2,3-triazol-1-yl)thiophene-2-carboxylate 5d: white solid (48 mg, 44%), m.p. 181–183 °C. 1H -NMR (400 MHz, $CDCl_3$) δ 2.34 (s, 3H), 3.65 (s, 2H), 3.87 (s, 5H), 7.26–7.30 (m, 1H), 7.35 (t, $J = 7.4$ Hz, 2H), 7.40–7.43 (m, 2H), 7.56 (d, $J = 5.4$ Hz, 1H), 7.64 (d, $J = 5.4$ Hz, 1H), 8.34 (s, 1H) ppm. ^{13}C -NMR (101 MHz, $CDCl_3$) δ 42.1 (CH), 51.9 (CH), 52.5 (CH), 61.2 (CH), 121.8 (C), 125.5 (CH), 126.6 (CH), 127.0 (CH), 128.3 (2 \times CH), 129.1 (2 \times CH), 131.0 (CH), 138.6 (C), 138.8 (C), 144.3 (C), and 160.6 (C) ppm. HRMS: calcd for $C_{17}H_{19}N_4O_2S$ $[M + H]^+$ 343.1223, found 343.1216.

Methyl 4-(5-(bromomethyl)-1H-1,2,3-triazol-1-yl)thiazole-5-carboxylate 6a: white solid (36 mg, 38%), m.p. 123–125 °C. ¹H-NMR (400 MHz, CDCl₃) δ 3.87 (s, 3H), 4.67 (s, 2H), 8.27 (s, 1H), 8.95 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 159.6 (C), 155.9 (CH), 147.4 (C), 144.1 (C), 124.8 (CH), 119.6 (C), 53.2 (CH), and 21.1 (CH) ppm. HRMS: calcd for C₈H₈BrN₄O₂S [M + H]⁺ 302.9546, found 302.9546.

Methyl 4-(5-(hydroxymethyl)-1H-1,2,3-triazol-1-yl)thiazole-5-carboxylate 6b: white solid (20 mg, 26%), m.p. 95–97 °C. ¹H-NMR (400 MHz, CDCl₃) δ 3.86 (s, 3H), 4.91 (d, *J* = 5.7 Hz, 2H), 8.20 (s, 1H), 8.93 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 53.2 (CH), 56.5 (CH), 119.3 (C), 123.6 (CH), 147.2 (C), 147.7 (C), 155.7 (CH), and 159.7 (C) ppm. HRMS: calcd for C₈H₉N₄O₃S [M + H]⁺ 241.0390, found 241.0390.

Methyl 4-(5-(acetoxymethyl)-1H-1,2,3-triazol-1-yl)thiazole-5-carboxylate 6c: yellow oil (64 mg, 72%). ¹H-NMR (400 MHz, CDCl₃) δ 2.08 (s, 3H), 3.84 (s, 3H), 5.29 (s, 2H), 8.25 (s, 1H), 8.93 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 20.9 (CH), 53.2 (CH), 57.4 (CH), 119.5 (C), 125.7 (CH), 142.3 (C), 147.5 (C), 155.9 (CH), 159.6 (C), and 170.8 (C) ppm. HRMS: calcd for C₁₀H₁₁N₄O₄S [M + H]⁺ 283.0496, found 283.0495.

Methyl 4-(5-((benzyl(methyl)amino)methyl)-1H-1,2,3-triazol-1-yl)thiazole-5-carboxylate 6d: yellow oil (62 mg, 57%). ¹H-NMR (400 MHz, CDCl₃) δ 2.34 (s, 3H), 3.65 (s, 2H), 3.88 (d, *J* = 5.3 Hz, 5H), 7.27–7.42 (m, 5H), 8.18 (s, 1H), 8.97 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 42.1 (CH), 51.8 (CH), 53.1 (CH), 61.3 (CH), 119.3 (C), 124.5 (CH), 127.1 (CH), 128.3 (2 × CH), 129.0 (2 × CH), 138.7 (C), 144.8 (C), 147.9 (C), 155.7 (CH), and 159.7 (C) ppm. HRMS: calcd for C₁₆H₁₈N₅O₂S [M + H]⁺ 344.1176, found 344.1172.

3.3. General Procedure for the Synthesis of Compounds 8 and 9a–d

A mixture of methyl anthranilate (50 mg, 1 equiv.), 2-bromopyridine (2 equiv.), Pd(OAc)₂ (0.03 equiv.), Xantphos (0.04 equiv.), and Cs₂CO₃ (2.5 equiv.) in eucalyptol (1.5 mL) was stirred at 120 °C for 18–24 h. The reaction was followed by TLC. After completion, the reaction was then cooled to room temperature, and the mixture was concentrated under vacuum. The solid obtained was purified by flash chromatography using a mixture of ethyl acetate/petroleum ether.

10H-pyrido[1,2-a]thieno[3,2-d]pyrimidin-10-one 8a: Yellow solid (56 mg, 87%), m.p. 208–210 °C. ¹H-NMR (400 MHz, CDCl₃) δ 6.99 (ddd, *J* = 7.6, 5.3, 2.6 Hz, 1H), 7.35 (d, *J* = 5.3 Hz, 1H), 7.56–7.61 (m, 2H), 7.91 (d, *J* = 5.3 Hz, 1H), 8.97 (d, *J* = 7.3 Hz, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 113.6 (CH), 115.4 (C), 124.9 (CH), 126.0 (CH), 126.3 (CH), 134.3 (CH), 136.6 (CH), 149.0 (C), 154.3 (C), and 157.8 (C) ppm (CAS: 1934255-23-8).

7-Chloro-10H-pyrido[1,2-a]thieno[3,2-d]pyrimidin-10-one 8b: Yellow solid (34 mg, 45%), m.p. 195–197 °C. ¹H-NMR (400 MHz, CDCl₃) δ 7.39 (d, *J* = 5.3 Hz, 1H), 7.55 (dd, *J* = 2.9, 1.5 Hz, 2H), 7.96 (d, *J* = 5.3 Hz, 1H), 9.00–9.05 (m, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 115.9 (C), 122.2 (C), 124.0 (CH), 125.0 (CH), 127.1 (CH), 135.6 (CH), 136.9 (CH), 147.3 (C), and 153.4 (C), 157.6 (C) ppm. HRMS: calcd for C₁₀H₆ClN₂OS [M + H]⁺ 236.9884, found 236.9885.

7-Methyl-10H-pyrido[1,2-a]thieno[3,2-d]pyrimidin-10-one 8c: White solid (28 mg, 40%), m.p. 177–179 °C. ¹H-NMR (400 MHz, CDCl₃) δ 2.42 (s, 3H), 7.38 (d, *J* = 5.4 Hz, 1H), 7.49 (dd, *J* = 9.2, 2.0 Hz, 1H), 7.56 (d, *J* = 9.2 Hz, 1H), 7.92 (d, *J* = 5.4 Hz, 1H), 8.83 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 18.4 (CH), 115.4 (C), 123.5 (CH), 123.8 (C), 124.8 (CH), 125.5 (CH), 136.3 (CH), 137.5 (CH), 148.2 (C), 154.3 (C), and 157.7 (C) ppm. HRMS: calcd for C₁₁H₉N₂OS [M + H]⁺ 217.0430, found 217.0435.

7-Methoxy-10H-pyrido[1,2-a]thieno[3,2-d]pyrimidin-10-one 8d: Yellow solid (32 mg, 43%), m.p. 183–185 °C. ¹H-NMR (400 MHz, CDCl₃) δ 3.94 (s, 3H), 7.39 (d, *J* = 5.4 Hz, 1H), 7.43 (dd, *J* = 9.7, 2.7 Hz, 1H), 7.57 (d, *J* = 9.7 Hz, 1H), 7.91 (d, *J* = 5.4 Hz, 1H), 8.49 (d, *J* = 2.7 Hz, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 56.4 (CH), 105.4 (CH), 115.3 (C), 124.8 (CH), 126.8 (CH), 130.5 (CH), 135.9 (CH), 146.5 (C), 149.5 (C), 154.2 (C), and 157.2 (C) ppm. HRMS: calcd for C₁₁H₉N₂O₂S [M + H]⁺ 233.0379, found 233.0381.

2-Phenyl-10H-pyrido[1,2-a]thieno[3,2-d]pyrimidin-10-one 9a: White solid (40 mg, 67%), m.p. 210–212 °C. ¹H-NMR (400 MHz, CDCl₃) δ 7.00 (ddd, *J* = 7.6, 5.0, 2.8 Hz, 1H), 7.39–7.47 (m, 3H), 7.55 (s, 1H), 7.57–7.62 (m, 2H), 7.74 (d, *J* = 6.8 Hz, 2H), 9.00 (d, *J* = 7.3 Hz, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 113.6 (CH), 114.8 (C), 120.0 (CH), 126.0 (CH), 126.4 (CH), 126.6 (2 × CH), 129.2 (2 × CH), 129.8 (CH), 133.1 (C), 134.3 (CH), 149.3 (C), 153.9 (C), 154.6 (C), and 158.5 (C) ppm. HRMS: calcd for C₁₆H₁₁N₂OS [M + H]⁺ 279.0587, found 279.0587.

7-Chloro-2-phenyl-10H-pyrido[1,2-a]thieno[3,2-d]pyrimidin-10-one 9b: Yellow solid (44 mg, 65%), m.p. 230–232 °C. ¹H-NMR (400 MHz, CDCl₃) δ 7.43–7.49 (m, 3H), 7.54–7.56 (m, 3H), 7.75 (dd, *J* = 8.0, 1.4 Hz, 2H), 9.02–9.04 (m, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 115.2 (C), 120.0 (CH), 122.2 (C), 124.1 (CH), 126.6 (2 × CH), 129.3 (2 × CH), 130.0 (CH), 133.0 (C), 135.6 (CH), 127.0 (CH), 147.6 (C), 153.0 (C), 155.0 (C), and 158.2 (C) ppm. HRMS: calcd for C₁₆H₁₀ClN₂OS [M + H]⁺ 313.0197, found 313.0196.

7-Methyl-2-phenyl-10H-pyrido[1,2-a]thieno[3,2-d]pyrimidin-10-one 9c: White solid (44 mg, 70%), m.p. 197–199 °C. ¹H-NMR (400 MHz, CDCl₃) δ 2.42 (s, 3H), 7.42–7.51 (m, 4H), 7.55 (d, *J* = 7.5 Hz, 2H), 7.75–7.78 (m, 2H), 8.82–8.85 (m, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 18.4 (CH), 114.8 (C), 120.0 (CH), 123.6 (CH), 123.7 (C), 125.5 (CH), 126.6 (2 × CH), 129.2 (2 × CH), 129.7 (CH), 133.3 (C), 137.5 (CH), 148.5 (C), 153.9 (C), 154.3 (C), and 158.4 (C) ppm. HRMS: calcd for C₁₇H₁₃N₂OS [M + H]⁺ 293.0743, found 293.0745.

7-Methoxy-2-phenyl-10H-pyrido[1,2-a]thieno[3,2-d]pyrimidin-10-one 9d: Yellow solid (43 mg, 65%), m.p. 184–186 °C. ¹H-NMR (400 MHz, CDCl₃) δ 3.95 (s, 3H), 7.42–7.50 (m, 4H), 7.55–7.59 (m, 2H), 7.75–7.78 (m, 2H), 8.51 (d, *J* = 2.7 Hz, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 56.4 (CH), 105.6 (CH), 114.7 (C), 119.9 (CH), 126.6 (2 × CH), 126.8 (CH), 129.2 (2 × CH), 129.7 (CH), 130.5 (CH), 133.3 (C), 146.8 (C), 149.6 (C), 153.8 (C), 153.9 (C), and 157.8 (C) ppm. HRMS: calcd for C₁₇H₁₃N₂O₂S [M + H]⁺ 309.0692, found 309.0692.

3.4. General Procedure for the Synthesis of Compounds 11–15a, and 11b

A mixture of bromo compound (50 mg), amino derivative (2 eq.), Pd(OAc)₂ (0.05 eq.), (±)-BINAP, 2,2'-Bis(diphenylphosphino)-1,1'-binaphthalene (0.1 eq.), K₂CO₃ (2 eq.) in CPME (1.5 mL) was stirred in MW at 110 °C. After completion the reaction was then cooled to room temperature and the mixture was concentrated under vacuum. The solid obtained was purified by flash chromatography using a mixture of ethyl acetate/petroleum ether

Methyl 5-phenyl-3-(5-((phenylamino)methyl)-1H-1,2,3-triazol-1-yl)thiophene-2-carboxylate 11a: yellow oil (43 mg, 84%). ¹H-NMR (400 MHz, CDCl₃) δ 8.32 (s, 1H), 7.71 (s, 1H), 7.67–7.64 (m, 2H), 7.45 (d, *J* = 7.4 Hz, 3H), 7.20 (t, *J* = 7.8 Hz, 2H), 6.73 (t, *J* = 7.1 Hz, 3H), 4.57 (s, 2H), 3.81 (s, 3H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 160.7 (C), 149.3 (C), 147.5 (C), 145.4 (C), 138.7 (C), 132.1 (C), 129.8 (CH), 129.3 (2 × CH), 129.3 (2 × CH), 126.1 (2 × CH), 124.5 (CH), 122.0 (CH), 118.1 (CH), 113.2 (2 × CH), 100.0 (C), 52.5 (CH), and 39.8 (CH) ppm. HRMS: calcd for C₂₁H₁₉N₄O₂S [M + H]⁺ 391.1223, found 391.1224.

Methyl 7-(5-((phenylamino)methyl)-1H-1,2,3-triazol-1-yl)-2,3-dihydrobenzo[b][1,4]dioxine-6-carboxylate 12a: orange oil (19 mg, 37%). ¹H-NMR (400 MHz, CDCl₃) δ 7.64 (s, 1H), 7.56 (s, 1H), 7.18 (t, *J* = 7.9 Hz, 2H), 6.94 (s, 1H), 6.71 (t, *J* = 8.1 Hz, 3H), 4.54 (s, 2H), 4.34 (d, *J* = 5.7 Hz, 5H), 3.57 (s, 3H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 164.6 (C), 147.6 (C), 146.8 (C), 145.6 (C), 144.3 (C), 130.5 (C), 129.3 (2 × CH), 124.5 (CH), 120.5 (CH), 120.1 (C), 118.0 (CH), 116.7 (CH), 113.2 (2 × CH), 64.6 (CH), 64.3 (CH), 52.3 (CH), and 39.8 (CH) ppm. HRMS: calcd for C₁₉H₁₉N₄O₄ [M + H]⁺ 367.1401, found 367.1398.

Methyl 6-(5-((phenylamino)methyl)-1H-1,2,3-triazol-1-yl)-1H-indazole-7-carboxylate 13a: orange solid (33 mg, 63%), m.p. 107–109 °C. ¹H-NMR (400 MHz, CDCl₃) δ 3.63 (s, 3H), 4.63 (s, 2H), 6.77 (dd, *J* = 12.0, 8.1 Hz, 3H), 7.27–7.20 (m, 3H), 7.76 (s, 1H), 8.08 (d, *J* = 8.2 Hz, 1H), 8.26 (s, 1H), 11.45 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 161.1 (C), 147.4 (C), 146.7 (C), 146.0 (C), 142.1 (C), 138.1 (C), 134.8 (CH), 130.2 (2 × CH), 126.4 (CH), 123.6 (CH), 119.6 (CH), 117.6 (CH), 116.3 (C), 113.3 (2 × CH), 52.2 (CH), and 40.4 (CH) ppm. HRMS: calcd for C₁₈H₁₇N₆O₂ [M + H]⁺ 349.1408, found 349.1405.

Methyl 3-(5-((phenylamino)methyl)-1H-1,2,3-triazol-1-yl)thiophene-2-carboxylate 14a: yellow solid (23 mg, 44%), m.p. 99–101 °C. ¹H-NMR (400 MHz, CDCl₃) δ 8.26 (s, 1H), 7.60 (d, *J* = 5.4 Hz, 1H), 7.50 (d, *J* = 5.4 Hz, 1H), 7.19 (t, *J* = 7.9 Hz, 2H), 6.76–6.70 (m, 3H), 4.56 (s, 2H), 4.30 (s, 1H), 3.79 (s, 3H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 160.7 (C), 147.5 (C), 145.4 (C), 138.4 (C), 131.0 (CH), 129.3 (2 × CH), 126.7 (CH), 124.5 (CH), 122.0 (C), 118.1 (CH), 113.2 (2 × CH), 52.5 (CH), and 39.8 (CH) ppm. HRMS: calcd for C₁₅H₁₅N₄O₂S [M + H]⁺ 315.0910, found 315.0909.

Methyl 4-(5-((phenylamino)methyl)-1H-1,2,3-triazol-1-yl)thiazole-5-carboxylate 15a: yellow oil (37 mg, 72%). ¹H-NMR (400 MHz, CDCl₃) δ 8.90 (s, 1H), 8.10 (s, 1H), 7.19 (t, *J* = 7.9 Hz, 2H), 6.72 (dd, *J* = 19.0, 7.9 Hz, 3H), 4.58 (s, 2H), 4.31 (s, 1H), 3.81 (s, 3H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 159.7 (C), 155.7 (CH), 147.7 (C), 147.4 (C), 145.8 (C), 129.3 (2 × CH), 123.5 (CH), 119.4 (C), 118.1 (CH), 113.2 (2 × CH), 53.1 (CH), and 39.8 (CH) ppm. HRMS: calcd for C₁₄H₁₄N₅O₂S [M + H]⁺ 316.0863, found 316.0862.

Methyl 3-(5-((benzofuran-5-ylamino)methyl)-1H-1,2,3-triazol-1-yl)-5-phenylthiophene-2-carboxylate 11b: orange oil (33 mg, 58%). ¹H-NMR (400 MHz, CDCl₃) δ 3.79 (s, 3H), 4.59 (s, 2H), 6.63 (s, 1H), 6.73 (dd, *J* = 8.8, 2.7 Hz, 1H), 6.88 (d, *J* = 2.7 Hz, 1H), 7.32 (d, *J* = 8.8 Hz, 1H), 7.43 (d, *J* = 7.2 Hz, 3H), 7.53 (s, 1H), 8.33 (s, 1H), 7.64 (d, *J* = 8.1 Hz, 2H), 7.71 (s, 1H) ppm. ¹³C-NMR (101 MHz, CDCl₃) δ 40.8 (CH), 52.5 (CH), 103.5 (CH), 106.4 (CH), 111.8 (CH), 112.9 (CH), 119.7 (C), 122.0 (CH), 124.6 (CH), 126.1 (2 × CH), 128.2 (C), 129.3 (2 × CH), 129.8 (CH), 132.1 (C), 138.7 (C), 143.7 (C), 145.3 (CH), 145.5 (C), 149.3 (C), 149.3 (C), and 160.7 (C) ppm. HRMS: calcd for C₂₃H₁₉N₄O₃S [M + H]⁺ 431.1172, found 431.1170.

4. Conclusions

In summary, we have disclosed a synthesis of triazole scaffolds using greener alternatives as solvents. The conditions reported for all classes of heterocycles studied make this methodology an interesting alternative to conventional strategies, as it avoids the use of metal catalysts, several-step reactions, and conventional petroleum solvents.

We have also developed an efficient, environmentally sound microwave-assisted method for a Buchwald–Hartwig Coupling/Pyridine Dearomatization Sequence. Applying CPME and 2-MeTHF as solvents, from methyl 3-aminothiophene-2-carboxylate and 3-amino-5-phenylthiophene-2-carboxylate, the final compounds were obtained with interesting yields.

In the last part of this manuscript, we demonstrated a Buchwald–Hartwig amination of bromo derivatives synthesized at the beginning of this work. Once again, we were able to successfully find an approach making use of microwave heating that was compatible with a green solvent. In this case, this achievement allowed a threefold improvement: shortening of the usual reaction time, CPME as an alternative to the solvents generally used in this type of reaction (DMF, for example), and good yields.

Supplementary Materials: The following are available online: ¹H-NMR and ¹³C-NMR Spectra of all Products.

Author Contributions: Conceptualization and methodology, J.F.C. and S.B.-R.; investigation and data curation, J.F.C.; Performance of the experiments, J.F.C., M.C., R.C. and B.P.; 99 writing—original draft preparation, J.F.C.; writing—review and editing, T.B. and S.B.-R.; supervision, project administration, and funding acquisition, S.B.-R. All authors have read and agreed to the published version of the manuscript.

Funding: This research received no external funding.

Data Availability Statement: The data presented in this study are available in Supplementary Materials.

Conflicts of Interest: The authors declare no conflict of interest.

Sample Availability: Samples of all compounds used are available from the authors.
