Figure S1. Comparison between ¹H NMR spectra of ethanol (blue), acetone (red) and hexane (green) extracts for *Tiborszallasi* variety.

Figure S2. Comparison between ¹H NMR spectra of ethanol (blue), hexane (red) and acetone (green) extracts for *Kompolti* variety.

Figure S3. Comparison between the enlarged region [6.25 ppm - 6.5ppm] of the ^1H NMR spectra from hexane extract of *Tiborszallasi* (blue) and *Kompolti* (purple) variety. A broad peak isolated at 6.40 ppm corresponding to the proton H-10 of Δ^9 -THC appears in the proton spectra of *Tiborszallasi* while this signal was undetectable in the ^1H NMR spectrum acquired for *Kompolti*.

Figure S4. Biplot of PCA carried out on NMR spectra of acetone (red dots), hexane (blue dots) and ethanol (orange dots) extracts of *Kompolti* variety of hemp. The scores plot showing the first two PCs (PC1 and PC2) with their respective variation. $R^2\text{X}(\text{PC1}) = 51.8\%$, $R^2\text{X}(\text{PC2}) = 17.5\%$.

Table S1. The ^1H NMR data of main cannabinoids in *Kompolti* inflorescences.
