

Figure S1

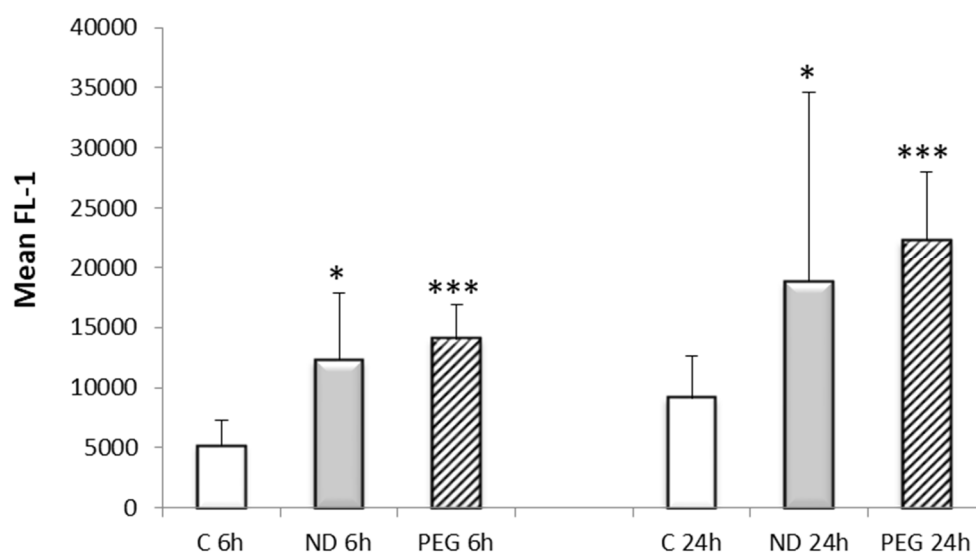

Figure S1. Cellular uptake of PEG-coated FITC labelled liposomes in liver cancer cells. Flow cytometry analysis of internalization of fluorescent liposomes in HepG2 and Huh7 after incubation of cells with synthesized PEG-coated liposomes at the indicated time points. Data in graphs are expressed as means \pm S.D of three independent experiments (* $p < 0.05$, *** $p < 0.001$ vs control; no significant differences was observed vs ND liposomes).
