1. Abbreviations:

PCP: Pentachlorophenol; DDT: Dichlorodiphenyltrichloroethane; HCB: Hexachlorobenzene; HCH: Hexacyclochlorohexane; DDE: Dichlorodiphenyldicloroethylene; PFOS: Perfluorooctanesulfonate; PFOA: Perfluorooctanoate; PFHxS: Perfluorohexanesulfonate; PFNA: Perfluorononanoate ; Me-PFOSA-AcOH: 2-(N-methylperfluorooctane sulfonamido) acetate.

2. Data analysis

In Table S3, variation extent (P, %) of POPs across pregnancy were evaluated from paired data in matched studies according to Eq.S1. C_1 represents the value of POPs levels measured in samples taken in earlier sampling period, C_2 represents value of POPs levels measured in samples taken in maximum sampling interval samples during pregnancy.

$$P = 100 \times (C_2 - C_1)/C_1 \cdots \cdots (S1)$$

3. Table S1. Information about the samples collection and the sampling time intervals between paired samples in different trimester from the same participants.

4. Table S2. Descriptive statistics for blood biochemical parameters in sequential blood samples.

**5. Table S3. Inter-period correlations, variation pattern and variation extent (%)
of POP levels across pregnancy in present study.**

Table S1: Information about the samples collection and the sampling time intervals between paired samples in different trimester from the same participants.

1. STI: Sampling time interval(d), We calculated the longest sampling time intervals during pregnancy in matched literature.
2. N: number of samples, (m, n) represents m samples taken in earlier sampling period and n samples taken in the longest sampling time intervals during pregnancy.
3. *: Difference showed in inter-trimester POP levels at $p=0.05$ in matched literature.
4. #: No test of significance in matched literature, variation pattern gained from descriptive statistics.
5. -: No data and test of significance in matched literature; UN: Levels of POPs unchanged; Y means correlations between sequential samples were significant at $p=0.05$; N means correlations between sequential samples were not significant at $p=0.05$.
6. Because of the available data given in published literature, we calculate the variation extent in three statistical descriptions of available data, respectively. Details are as follow: **a:** Variation and correlation were calculated by Eq. S1, C values used mean levels of POPs in matched literature; **b:** Variation and correlation were calculated by Eq. S1, C values used median levels of POPs in

matched literature; **c**: Variation and correlation were calculated by Eq. S1, C values used geomean levels of POPs in matched literature; **d**: Extent calculated by Eq. S1, C values used median of P values by Eq. 2 in our study. Only two studies (Adetona et al. 2013)(Curley and Kimbrough 1969) use mean values and mean levels of POPs, that possibly contributed to the large variation extents.
