Instrumentation

NMR spectra were obtained using JEOL ECA-500 or Bruker AVANCE 400 spectrometer. Chemical shifts are expressed in δ (ppm) values, and coupling constants are expressed in hertz (Hz). ^1H NMR spectra were referenced to the tetramethylsilane (TMS) as an internal standard. The following abbreviations are used: s = singlet, d = doublet, m = multiplet, and brs = broad singlet. High-resolution mass spectra (HRMS) were recorded using a Bruker Daltonics solariX spectrometer (MALDI). Electronic absorption spectra were recorded on a JASCO V-770 spectrophotometer. Fluorescence spectra were obtained using a HITACHI F-4500 spectrofluorometer. Absolute fluorescence quantum yields (Φ_{PL}) were measured using a calibrated integrating sphere system (Quantaaurus-QY Plus C13534-22, Hamamatsu photonics). Time-resolved photoluminescence lifetime (τ) measurements were carried out using a time-correlated single photon counting lifetime spectroscopy system (Quantaaurus-Tau C11367-22, Hamamatsu photonics). The decay constants and fitting parameters for the transient decays were determined using the software embedded in the Quantaaurus-Tau system. Cyclic voltammetry (CV) measurements were recorded using a Hokuto Denko HZ7000 potentiostat under a nitrogen atmosphere with 0.1 M of tetrabutylammonium perchlorate (TBAP) as the supporting electrolyte. Measurements were made using a glassy carbon electrode (area = 0.07 cm²), an Ag/AgCl reference electrode, and a Pt wire counter electrode. The concentration of the solution was fixed at 0.5 mM, and the sweep rate was set to 100 mV/s. The ferrocenium/ferrocene (Fc^+/Fc) couple was used as an internal standard. Ionization potentials were determined from the onset of the photoelectron spectroscopy in air (AC-2, Riken Keiki).

Computational Details

Geometry optimization for all molecules was performed at the DFT level, by means of the hybrid Becke3LYP [36–39] (B3LYP) functional as implemented in Gaussian 16 [40]. The 6-31G(d) basis set was used for the all atoms. After the geometry optimization, the time-dependent (TD) DFT calculations [41,42] were performed to evaluate the stick absorption spectrum employing the same level or ω B97XD [43] and basis set. All calculations used a relatively simple self-consistent reaction field (SCRF) method based on the polarizable continuum model (PCM) [44] that mimicked the solvation effect of dichloromethane ($\epsilon = 8.93$). All stationary points were optimized without any symmetry assumptions, and characterized by normal coordinate analysis at the same level of theory (the number of imaginary frequencies, NIMAG was 0).

Table S1. Calculated excited wavelengths (λ) and oscillator strengths (f) for components of selected transition energies. Calculations were performed at the ω B97XD/6-31G*//B3LYP/6-31G* level of theory using a polarizable continuum model (PCM), which mimicked the solvation effect of dichloromethane.

Excited State 1: Singlet-A 1.9743 eV 627.99 nm f=0.4190 <S**2>=0.000
202 ->203 0.70144

This state for optimization and/or second-order correction.

Total Energy, E(TD-HF/TD-DFT) = -4228.36747882

Copying the excited state density for this state as the 1-particle RhoCI density.
