

Supplementary Data

A new tetracyclic bromopyrrole-imidazole derivative through direct chemical diversification of substances present in natural product extract from marine sponge *Petrosia (Strongylophora)* sp.

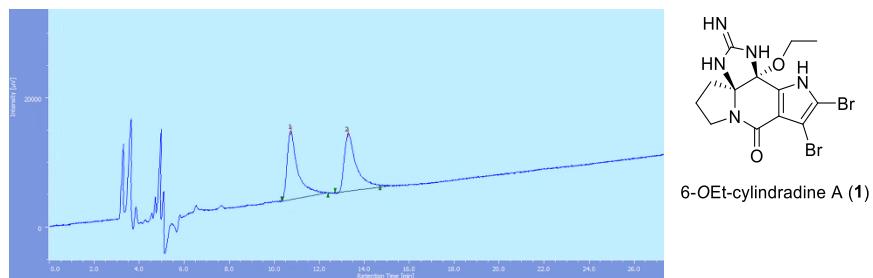

Figure S11. Chiral HPLC chromatograms of *rac*-6-OEt-cylindradine A (**1**). A HPLC system was composed of a PU-2089 Plus quaternary gradient pump, a CO-2065 Plus intelligent column oven, a MD-2010 Plus multiwavelength detector, and LC-NetII/ADC (Jasco Corporation, Japan). Chiral separation was performed on a CHIRALPAK® IE, 4.6×250 mm. The mobile phase was hexane:EtOH:diethylamine = 85:15:0.1, and flow rate was 1 mL/min at room temperature. The UV detection wavelength was set at 254 nm.

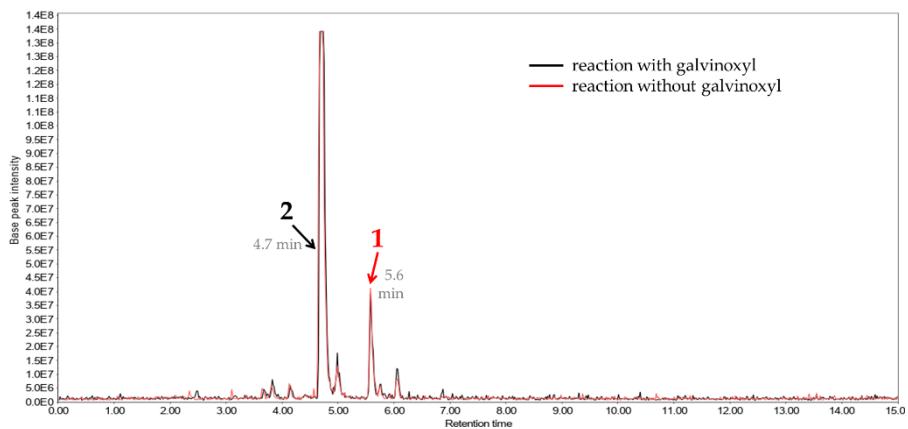

Figure S12. RP-LCMS base peak chromatogram (positive ion mode) after heating of (-)-cylindradine A (**2**) with EtOH and presence (black line) or absence of 5% w/w galvinoxyl (red line). Peaks of *rac*-6-OEt-cylindradine A (**1**) at 5.6 min and **2** at 4.7 min are pointed by red and black arrows, respectively.

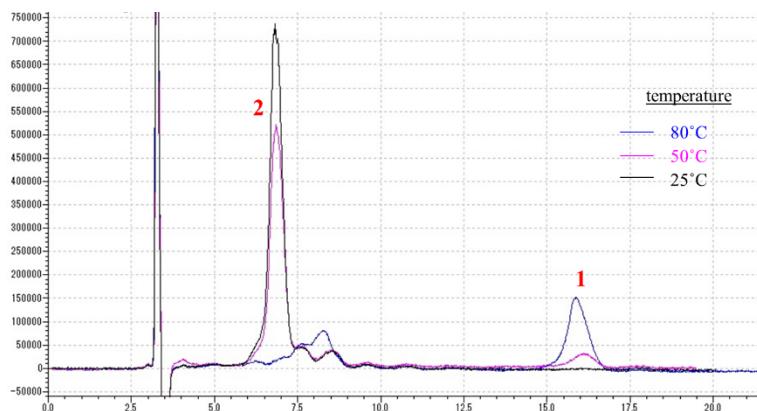

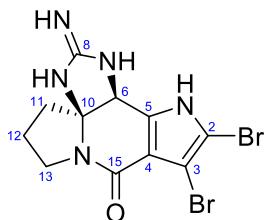

Figure S13. RP-HPLC chromatograms after heating of (-)-cylindradine A (**2**) with EtOH at various temperatures. The reactions of **2** were carried out at 25°C (black line), 50°C (pink line), and 80°C (blue line) for 72 hours. HPLC analyses of **2** and *rac*-6-OEt-cylindradine A (**1**) were performed using XBridge C18 Column. The mobile phase was MeOH:water:formic acid = 35:65:0.1, and flow rate was 0.5 mL/min at 25°C. The entire wavelength range of a PDA detector was set.
