Figure S1: The chemical structure of six DAP metabolites

Figure S2: The linearity diagram of all DAP metabolites

Figure S3: The carry-over study

Figure S4: Comparative extraction procedures (QuEChERS, lyophilisation and liquid-liquid extraction)

Figure S5: The chromatogram of the real urine sample analysed for DAP metabolites

Table:1S. Group statistics of the exposed sample (100) and the control (50)

Table:S2 Data of 100 exposed and 50 control samples with their six DAP metabolite concentrations.

Figure S1: The chemical structure of six DAP metabolites

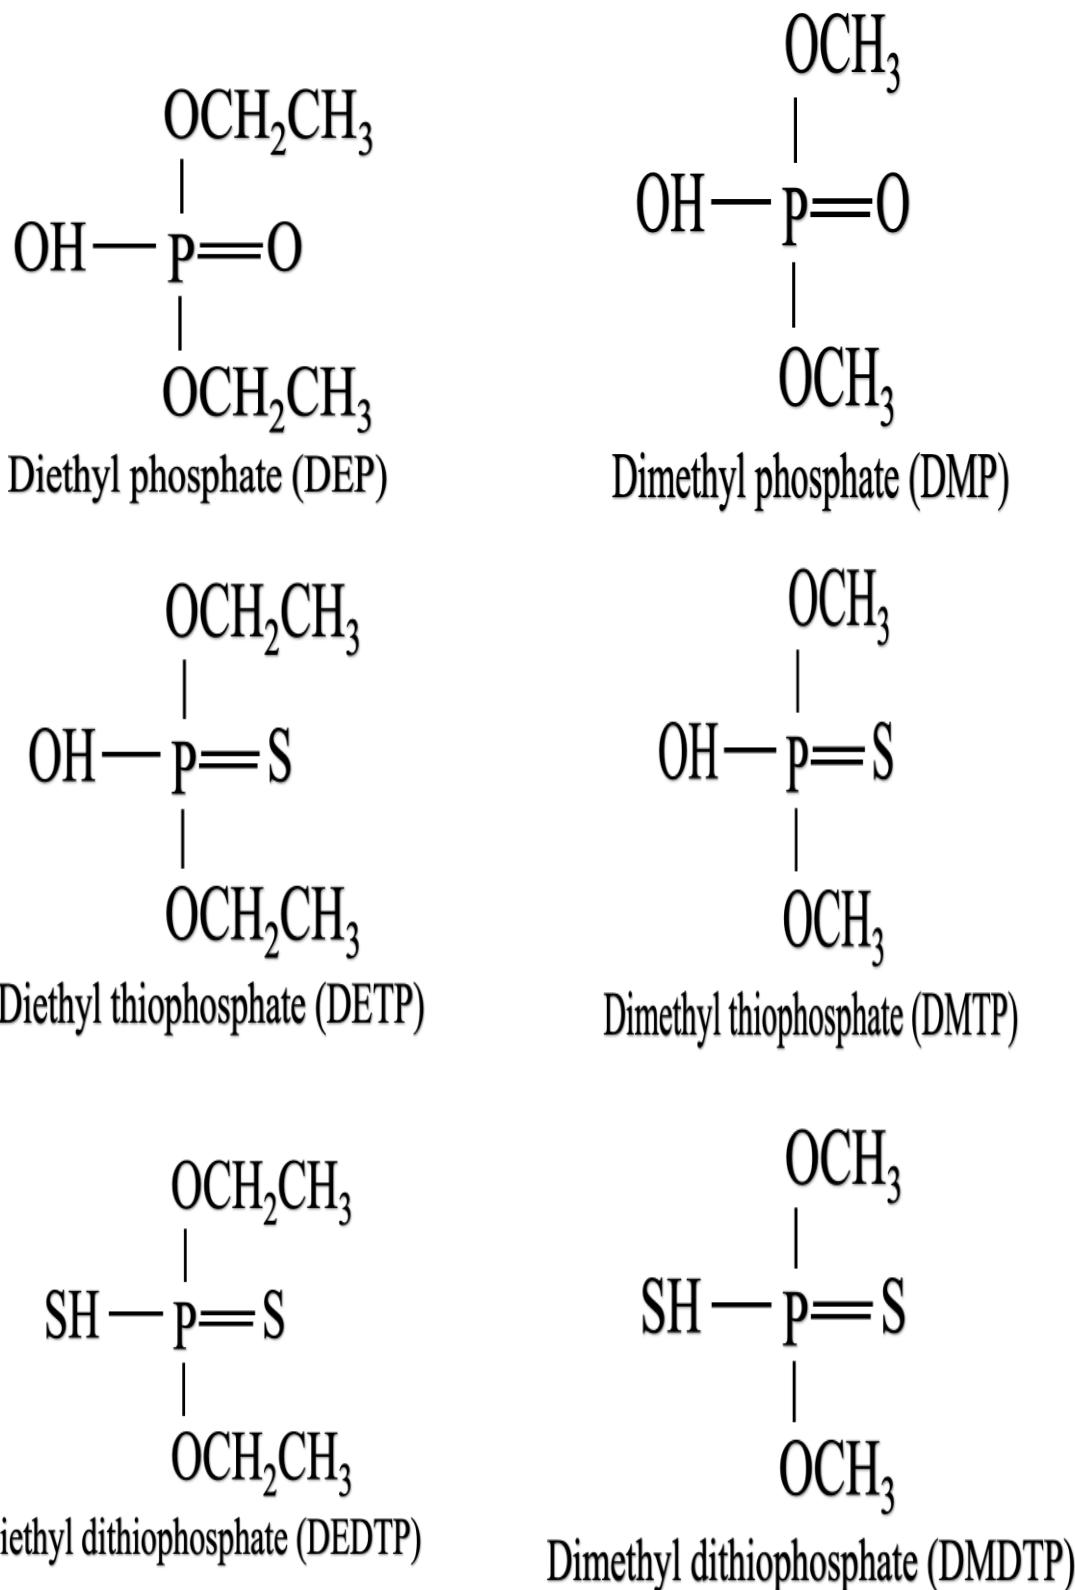

Figure S2: The linearity diagram of all DAP metabolites

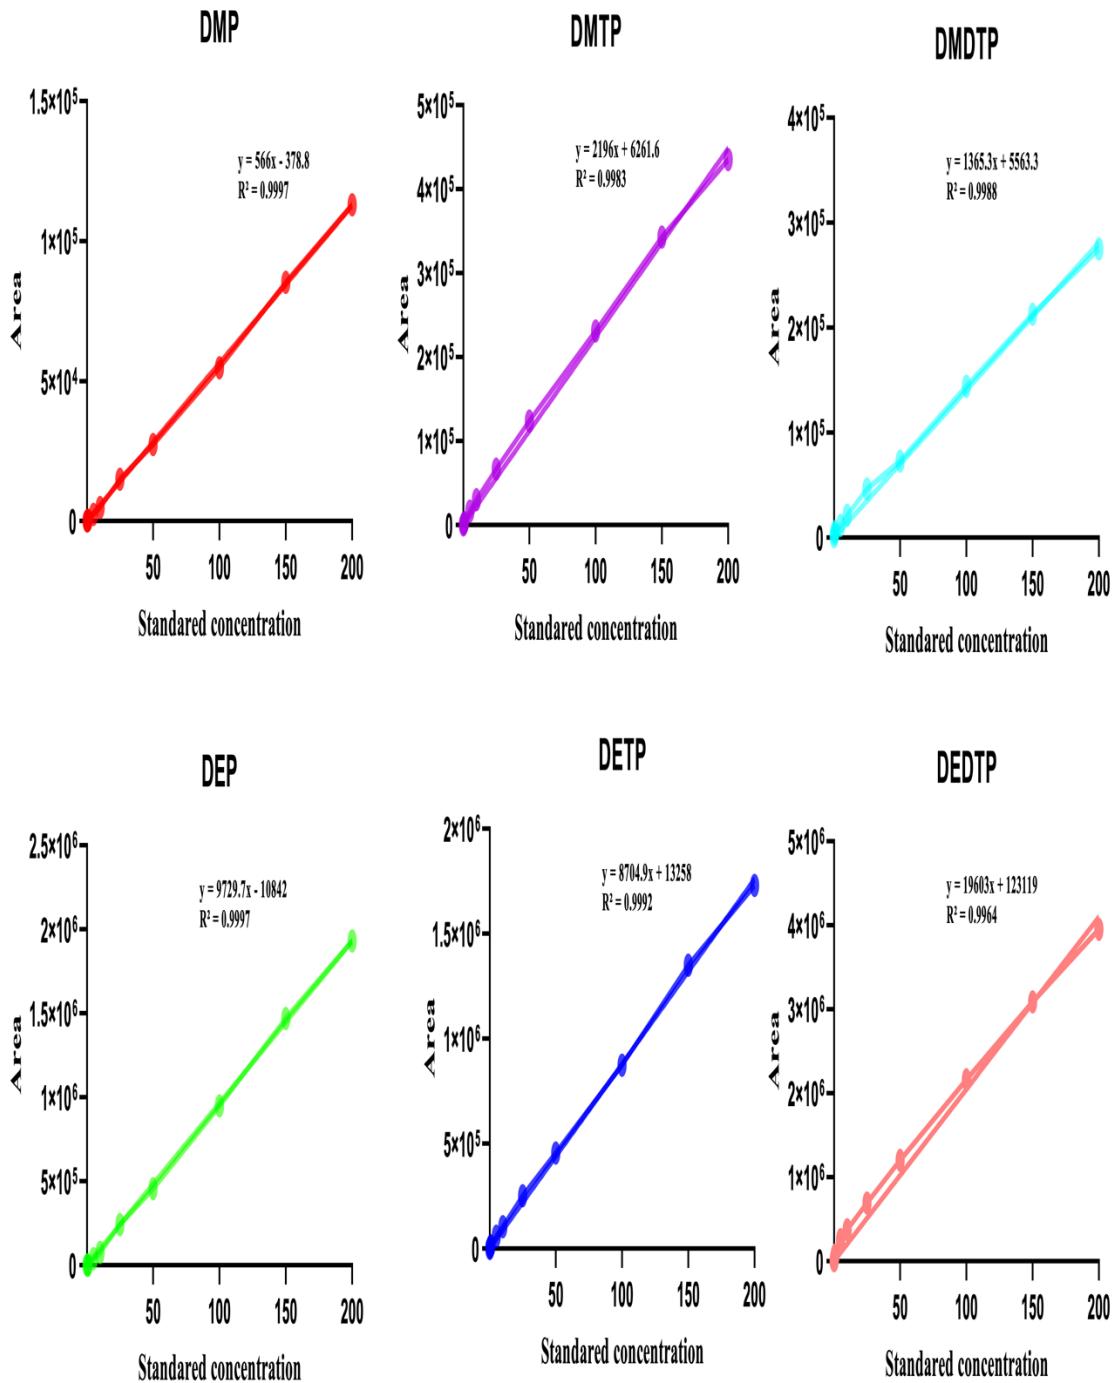

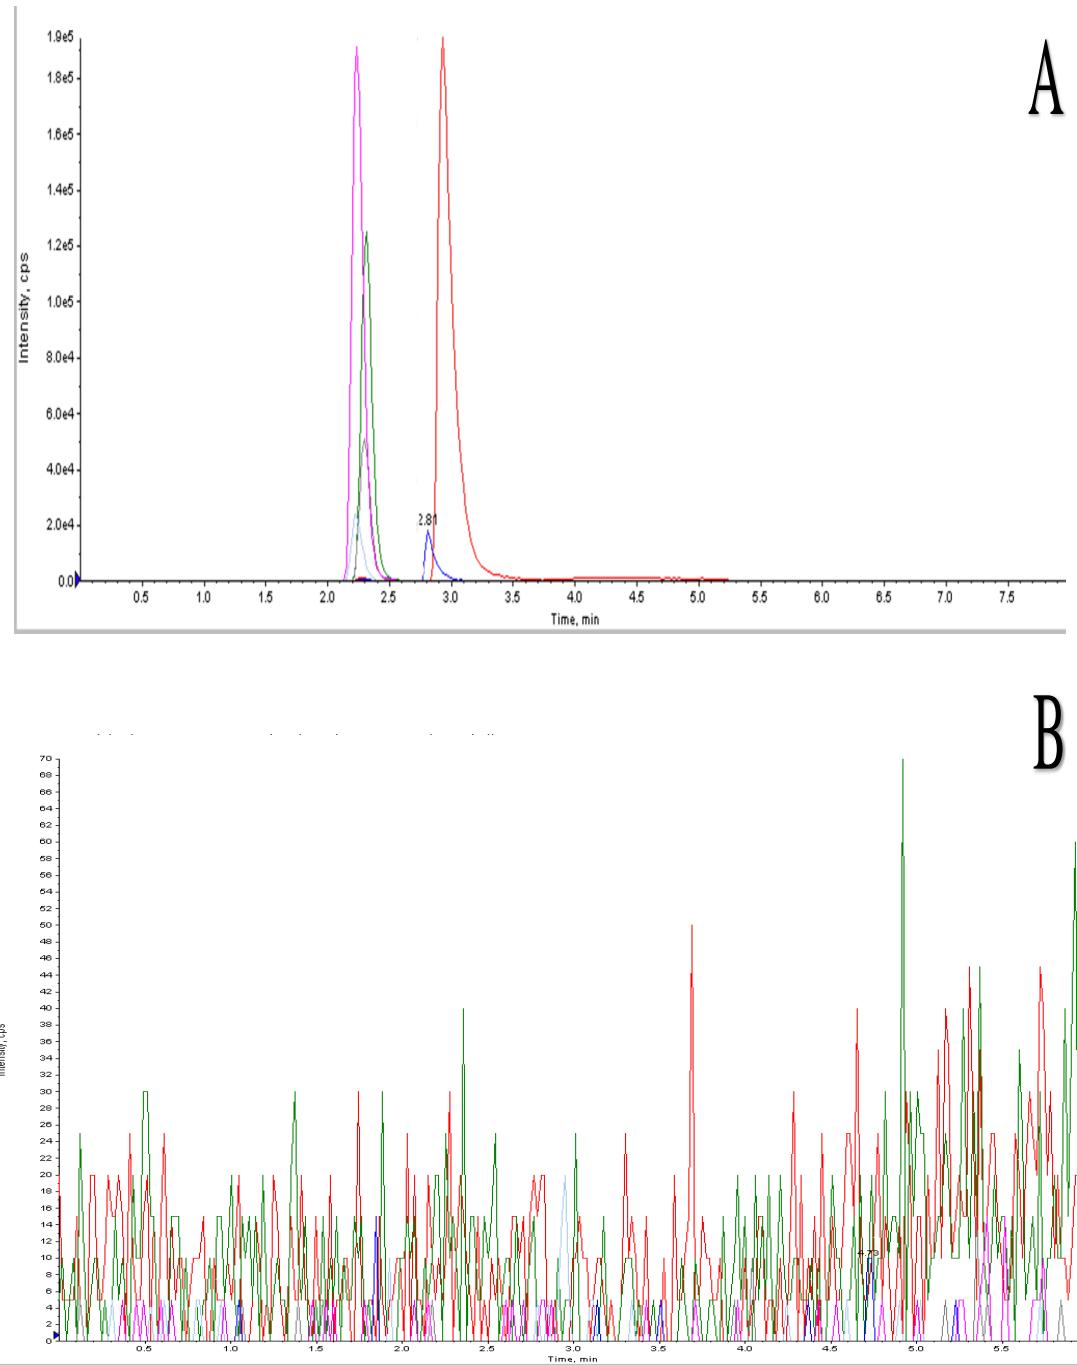

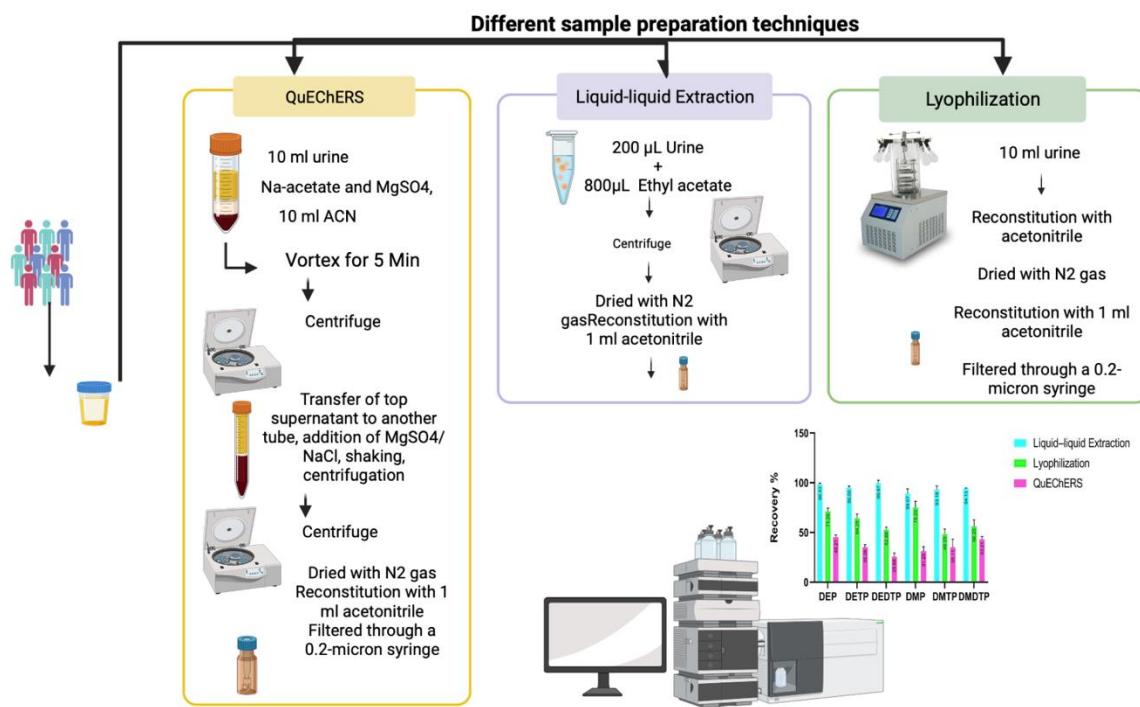

Figure S3: The carry-over study

Based on the carryover study, which involved the analysis of a 200 ng/mL standard sample, it was observed that after B examined the blank (mobile phase), there were no other interfering analytes carried forward to the subsequent chromatographic run.

Figure S4: Comparative extraction procedures (QuEChERS, lyophilisation and liquid-liquid extraction)

For each extraction process in the lyophilization method, a series of procedures were carried out. The dried sample was then combined with different solvents such as H₂O, methanol, and a mixture of H₂O and ACN (acetonitrile). The best solvent for extraction was chosen for the subsequent recovery study. In the official AOAC QuEChERS (Quick, Easy, Cheap, Effective, Rugged, and Safe) method, the prescribed procedures were followed strictly to ensure accurate and reliable results. Various solvents including hexane, ethyl ether, methanol, and benzene were used for liquid-liquid extraction (LLE). Ethyl acetate was found to be the most favourable solvent for extraction after comparative analysis.

Figure S5: The chromatogram of the real urine sample analysed for DAP metabolites
