

Table S1. Modification the chemical composition using chemical and physical factor in plants under the conditions

Species	Modifying factor/conditions	Effect	References
<i>Hylocereus polyrhizus</i>	Polyphenol oxidase, CYP76AD3 and 4,5-DOPA dioxygenase extradiol-like protein; <i>in vivo</i>	Betaine biosynthesis	[29]
<i>Hylocereus monacanthus</i>	Autopolyploization; <i>in vivo</i>	Reduction in the concentration of sugars and betacyanins, increase in the amount of amino acids, intermediates of the TCA cycle, organic acids and flavonoids	[30]
<i>Amaranthus caudatus</i>	Cytokines <i>in vivo</i>	Increase in the content of betacyanins	[42] [43]
<i>Amaranthus caudatus</i>	Absciscic acid (ABA) <i>in vivo</i>	Decrease in betacyanin content	[44]
<i>Hylocereus undatus</i>	Trypsin <i>in vivo</i>	Fatty acid elongation three unsaturated fatty acids were upregulated, while eight saturated fatty acids were downregulated	[31]
<i>Hylocereus polyrhizus</i>	Heat stress + 40°C <i>in vivo</i>	Content increase glycerol tributanoate, cis-aconitate, L-isoleucine, and mesaconic acid	[32]
<i>Hylocereus undatus</i>	Induced wound <i>in vivo</i>	Phenol biosynthesis	[33]
<i>Solanum lycopersicum</i>	Biotic and abiotic stress <i>in vivo</i>	Increasing the accumulation of carotenoids	[45]
<i>Hylocereus polyrhizus</i>	Red light radiation of fruit <i>in vivo</i>	Decrease in D-fructose, D-glucose, mannose, sorbose, D-turanose, glucopyranose and D-glucopyranoside content of octadecanoic acid, hexadecanoic acid, eicosanoic	[34]

		<p>acid, ethanedioic acid, pentanedioic acid and tyrosine</p> <p>volatile compounds have changed significantly</p> <p>content of hexanal, 2-hexenal, 2-heptenal and 4-heptenal significantly decreased, cyclohexenone, 1-hexanol significantly increased</p> <p>2-hydroxy-cyclopentadecanone and 2-octenal acid increased significantly</p>	
<i>Hylocereus undatus</i>	<p>Red and blue light in a ratio of 1 : 2</p> <p><i>in vitro</i></p>	<p>Accumulation of sucrose, glucose, fructose, fructose-6-phosphate, fatty acid and flavonoids increased significantly</p>	[35]
<i>Hylocereus polyrhizus</i>	<p>PEG-induced drought stress</p> <p><i>in vitro</i></p>	<p>Increased osmolyte accumulation, lipid peroxidation and antioxidant enzyme activity</p>	[36]
<i>Hylocereus costaricensis</i>	<p>Elicitors (silver nitrate, yeast extract), amino acids, tyrosine, leucine</p> <p><i>in vitro</i></p>	<p>Increasing the content of betaine</p>	[37]
	<p>Red light</p> <p><i>in vitro</i></p>	<p>Enhanced betalain synthesis 3,8-fold and 4,8-fold</p>	
<i>Hylocereus polyrhizus</i>	<p>Tyrosine</p> <p><i>in vitro</i></p>	<p>Supporting the accumulation of betacyanin, betaxanthin, phenol and flavonoids</p>	[38]
<i>Berberis vulgaris</i>	<p>Tyrosine</p> <p><i>in vitro</i></p>	<p>Increase in betacyanin content</p>	[46]
<i>Hylocereus polyrhizus</i>	<p>Methyl jasmonate</p> <p><i>in vivo</i></p>	<p>Fruit treatment increases betacyanin content and antioxidant activity</p>	[39]
<i>Hylocereus costaricensis</i>	<p>Low sucrose</p> <p><i>in vitro</i></p>	<p>Stimulation of the activity of betalain compounds and antioxidants</p>	[40]

<i>Hylocereus polyrhizus</i>	Salicylic acid <i>in vitro</i>	Increase in the production of betalains	[41]
<i>Alternanthera tenella</i>			[47]
<i>Elaeagnus angustifolia</i>		Increase in alpha-tocopherol synthesis	[48]
<i>Vitis vinifera</i>		Increasing anthocyanin synthesis	[49]
<i>Andrographis paniculata</i>		Increasing the synthesis of flavonoids	[50]
<i>Mentha piperita</i> L.	2-Isopentyladenine (2iP) and indolyl-3-acetic acid (IAA) <i>in vitro</i>	Increasing the content of mentofuro lactone	[51]
<i>Phoenix dactylifera</i> L.	2-Isopentyladenine (2iP) and 2,4-dichlorophenoxyacetic acid (2,4-D) <i>in vitro</i>	Increasing the production of phenolic compounds, flavonoids	[52]
<i>Vaccinium corymbosum</i> L.	Zeatin <i>in vitro</i>	Increasing the content of lipophilic compounds	[53]
<i>Hordeum</i> Spring barley	(6-(3-methoxybenzylamino)-9-(β-d-arabinofuranosyl)purine - cytokinin derivative) <i>in vitro</i>	Grain yield increase	[54]
<i>Artemisia argyi</i>	Absciscic acid (ABA) <i>in vivo</i>	Stimulates the biosynthesis of many secondary metabolites, including phenylpropanoids, flavonoids, terpenoids, alkaloids	[55]
<i>Calendula officinalis</i>	Jasmonic acid <i>in vitro</i>	Increasing the synthesis of saponins	[56]
<i>Solanum lycopersicum</i> cv. Grape	methyl jasmonate <i>in vivo</i>	Induced the production of amino acids and fatty acids inducing the accumulation of α-tocopherol and β-sitosterol	[57]
<i>Brassica napus</i> L.	Gibberellic acid (GA3)	Increase in the content of oleic acid	[58]

	<i>in vivo</i>		
<i>Nitraria tangutorum</i>	Indolyl-3-acetic acid (IAA), abscisic acid (ABA) and gibberellic acid (GA3) <i>in vivo</i>	significantly increased the content of osmotic regulatory substances (soluble sugar, soluble protein, and proline) and antioxidant enzymes (SOD and POD)	[59]
<i>Nelumbo nucifera</i> Gaertn	Absciscic acid (ABA) <i>in vivo</i>	Increase in starch content	[60]
<i>Lavendula angustifolia</i> 'Luoshen'	Methyl jasmonate <i>in vivo</i>	Increase in the content of volatile substances (monoterpenoids and sesquiterpenoids)	[61]
<i>Citrus sinensis</i> L. Osbeck	Methyl jasmonate <i>in vivo</i>	Change in the content of volatile compounds increase in the emission of E- β -ocimene, indole	[62]
<i>Quercus pyrenaica</i>	Methyl jasmonate <i>in vivo</i>	Overall composition did not differ but showed higher emissions of volatile compounds	[63]
