Figure S6

Figure S1: Activity of Hh pathway agonist and antagonist controls in Hh-responsive cell lines C3H10T1/2 and *Gli*-reporter NIH3T3 cellular assays. **(A)** For agonist dose response curves, SAG or PUR were added to C3H10T1/2 cells at the indicated concentrations and cells incubated for a further 5 days. For antagonist dose response curve, C3H10T1/2 cells were stimulated with SAG at its EC₅₀ value (30 nM) and KAAD-cyc added at the indicated concentrations. AP activity was measured using a fluorescent substrate as described in Methods. All experiments conducted as a minimum of three independent experiments. **(B)** For agonist dose response curves, SAG was added to *Gli*-reporter NIH3T3 cells at the indicated concentrations and cells incubated for a further 30 h. For antagonist dose response curve, *Gli*-reporter NIH3T3 cells were stimulated with SAG at its EC₅₀ value (26 nM) and KAAD-cyc added at the indicated concentrations. One-step luciferase assay was performed as described in Methods. Data are presented as the mean of fold change of GLI luciferase reporter expression \pm SD of three replicates. EC₅₀ and IC₅₀ values were determined by non-linear regression in GraphPad Prism 9.

Figure S2: Screening of GANT61 analog set in C3H10T1/2 cells using AP absorbance assay. **(A)** Representative heat map profile for Hh-pathway inhibitory effects of the GANT61 analog set in C3H10T1/2 cells. C3H10T1/2 cells were stimulated with SAG at its EC₅₀ value (30 nM), GANT61 analogs added in dose response at the indicated concentrations and after 5 days, AP activity was measured at 405 nm using *p*NPP substrate. Each row represents dose response data for a single GANT61 analog. The heat map key indicates red for maximum inhibition through to pale green for minimal inhibition. Red arrows indicate GANT61 analogs selected for further study. **(B)** Dose response curves for selected GANT61 analogs in C3H10T1/2 cells using colorimetric readout as in A. Data were normalized to SAG-stimulated cells and displayed as the mean of % activity (n =

3 independent experiments). Dose response curves were generated using non-linear regression and IC₅₀ values determined in GraphPad Prism 9.

Figure S3: Effects of selected GANT61 analogs in C3H10T1/2 stimulated by different Smo agonists. C3H10T1/2 cells were treated with a fixed concentration of either SAG (30 nM) or PUR (500 nM) and GANT61 analogs added at the indicated concentrations. After 5 days, AP activity was measured using the fluorescence substrate and readout. Dose response curves were generated using non-linear regression and IC₅₀ values determined in GraphPad Prism 9.

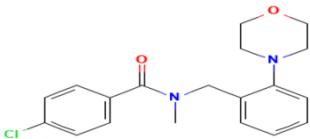

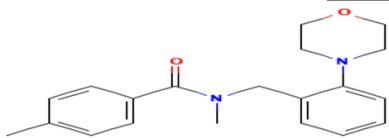

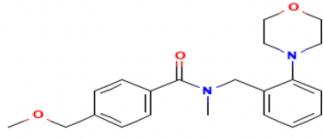

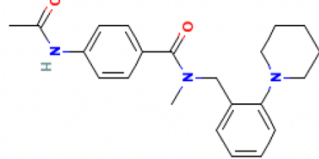

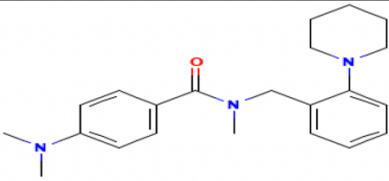

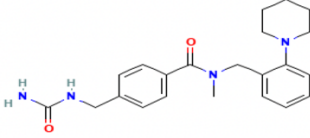

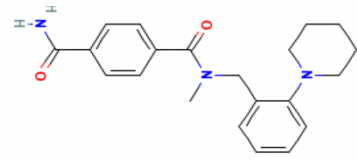

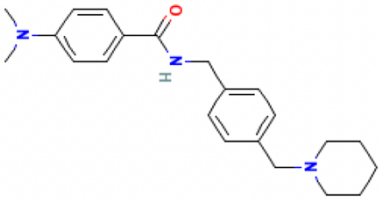

Figure S4: Time course of *Gli1* mRNA expression in C3H10T1/2 cells. **(A)** SAG induction of *Gli1* mRNA expression at different time points. C3H10T1/2 cells were treated with SAG at its EC₅₀ (30 nM), cells collected at the indicated time points for RNA extraction and cDNA synthesis. *Gli1* mRNA expression was determined using TaqMan qRT-PCR. **(B)** KAAD-cyc inhibition of SAG-induced *Gli1* mRNA at 48 h in C3H10T1/2 cells. Cells were treated with 30 nM SAG with and without KAAD-cyc at its IC₉₀ value (40 nM). Data was normalized to the housekeeping gene β -actin and displayed as the mean of fold change of *Gli1* mRNA expression \pm SD of three independent experiments. Two-tailed t-test and Mann-Whitney test represent SAG + KAAD-cyc significantly different (****p-value <0.0001) from SAG alone.

Figure S5: Quantification of *GLI1* and *GLI2* mRNA expression in tumor cells. **(A)** Glioblastoma U87MG and T98G. **(B)** Lung cancer SK-MES-1 and H1437. *GLI1* and *GLI2* mRNA was quantified using TaqMan RT-PCR. The housekeeping gene *GAPDH* was used for normalization and to determine fold change using the $2^{-\Delta\Delta C_t}$ method. Data presented as the mean of the relative

quantification of mRNA \pm SD of three replicates.–One-way ANOVA and Tukey's multiple comparisons show significantly different (* and **p-value < 0.05) expression of GLI1 and GLI2 mRNA between cell lines.

Figure S6: Molecular docking to predict the binding mode of GANT61 to GLI1 using the crystal structure of the five-zinc finger domain (PDB ID: 2GLI1). Best-ranked docking pose predicted binding of GANT61 to GLI1-ZF domain at amino acid residues Glu334 and Arg348. Ligand interactions were generated in MOE software.
