(1) Energy barriers and reaction enthalpies

According to the reaction class-transition state theory, the first small reaction in each reaction subclass are chosen as reference reactions and other reactions in [Table 1](#) are chosen as target reactions. The differences of the energy barriers and reaction enthalpies for reference reactions between the approximate method (M06-2X) and the accurate method (CBS-QB3) are calculated and the results are listed in [Table S1](#). These differences from reference reactions are used as the corrections to energy barriers and reaction enthalpies for target reaction in the same reaction class.

Table S1. Energy barriers and reaction enthalpies for reference reactions (unit: kcal/mol)

Reaction class	Reaction	ΔV		$\Delta\Delta V^\ddagger$	ΔH		$\Delta\Delta H^b$

(3) Noun interpretation

Table S4. The full names of abbreviations

CBS-QB3	Complete Basis Set
HEAT	High accuracy Extrapolated Ab initio Thermochemistry

CCSD(T)	Coupled Cluster theory with Single and Double excitations and a quasi-perturbative treatment of connected Triple excitations
cc-pvtz	correlation-consistent polarized valence triple- ζ basis set
B3LYP	Becke's three-parameter hybrid method with Lee-Yang-Parr correlation correction
