

► Supplemental Figure 1

Supplemental figure 1. The effect of GRP on adipocyte differentiation of 3T3-L1 cells. (A) During differentiation, GRP (100 nM) was co-treated with DMI (DEX, IBMX, and insulin). Adipogenic cells were observed and stained with Oil Red O under a phase contrast microscope. (B) The effect of GRP on adipogenic differentiation markers was analyzed by Real-time PCR using primers specific to *C/EBP-β* or *PPAR-γ*. *P < 0.05 compared to Day 0.
