This study		Han Chinese	481	Angiographically confirmed CAD	-	--	rs3735167	0.007	0.038

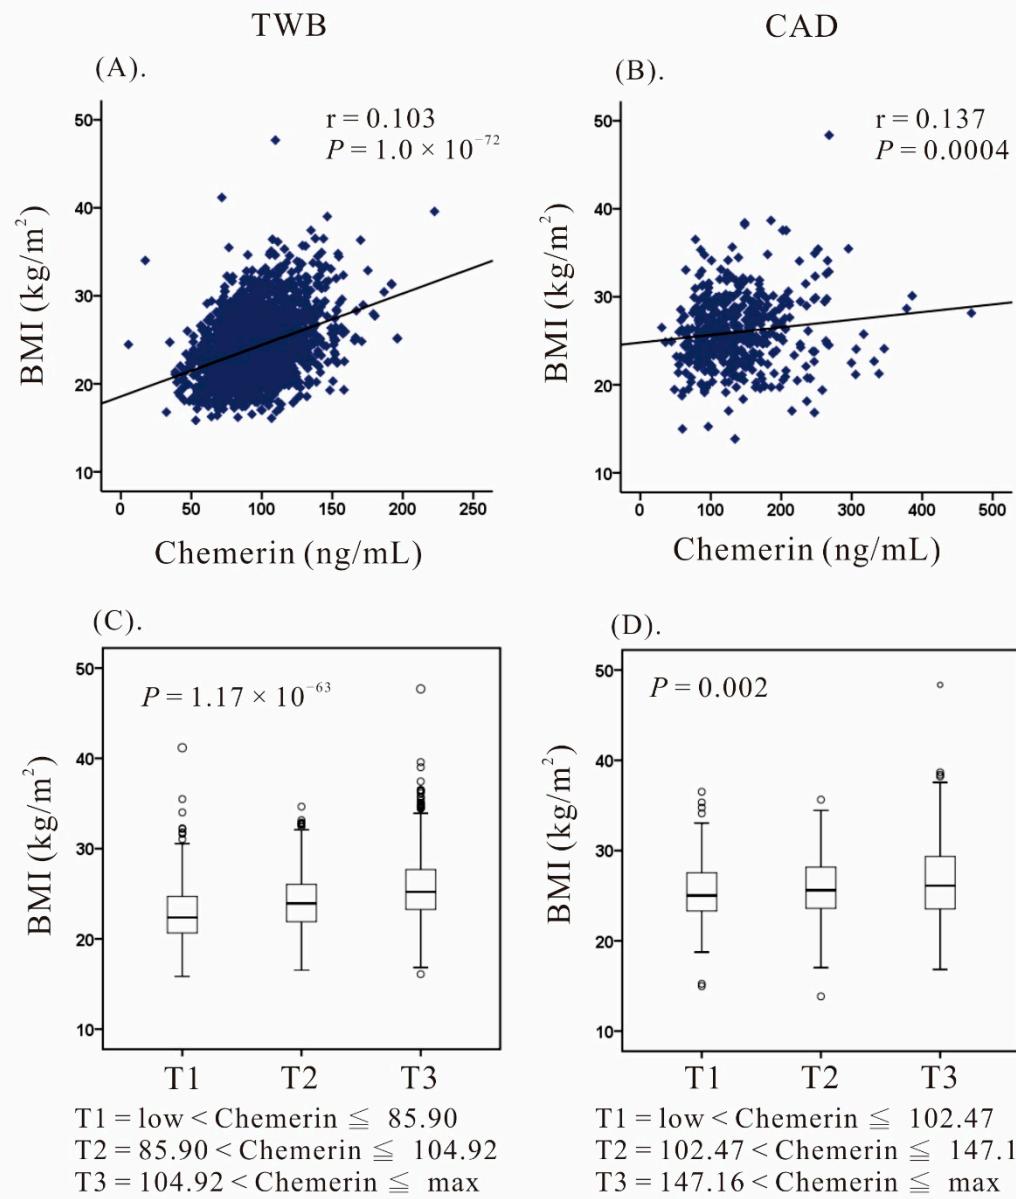

SNP: single nucleotide polymorphism; NA: not available.

^a Including patients with significant coronary artery disease (CAD) (247) and nonsignificant CAD (248).

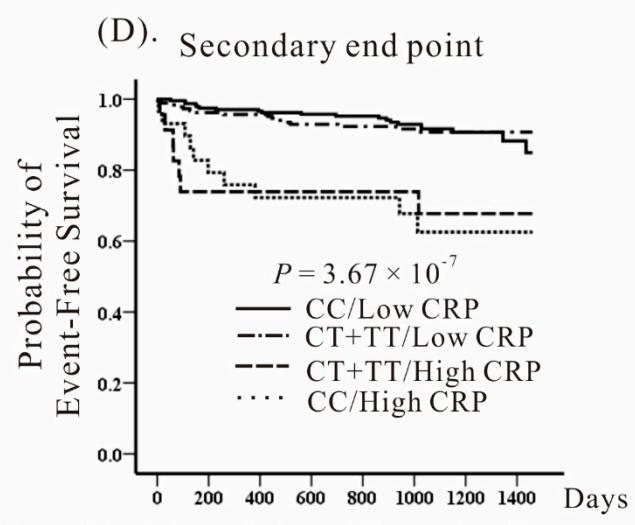

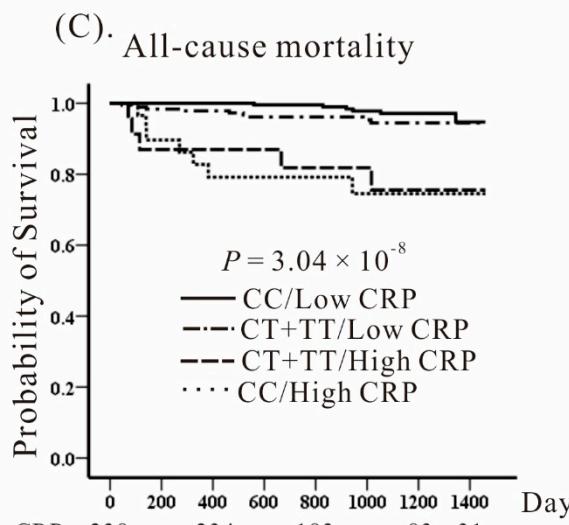

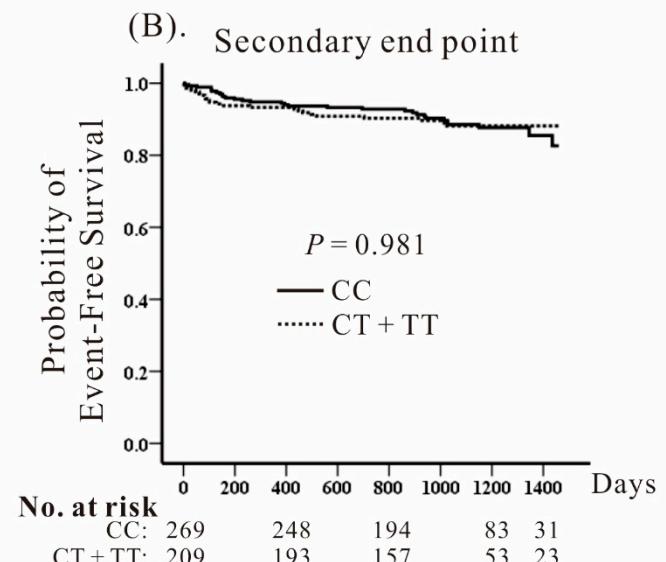

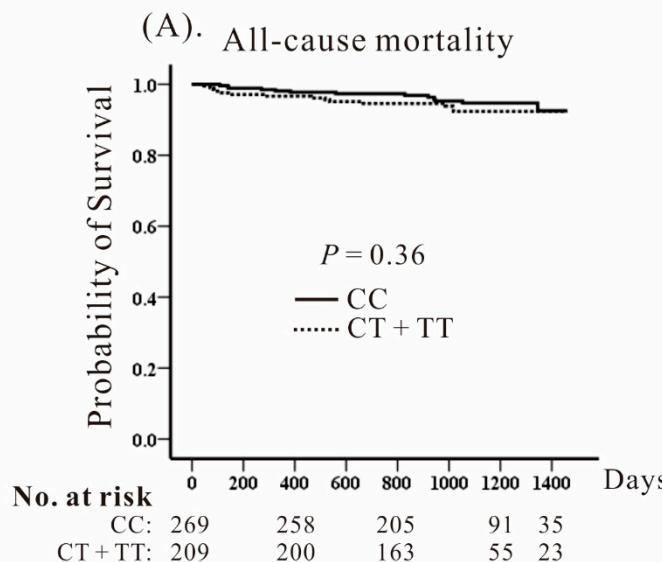

Supplementary Figure 1A and 1B

Supplementary Figure 2

Supplementary Figure 3

Supplementary Figure Legend

Supplementary Figure 1. Manhattan plots of the genome-wide association study for chemerin levels.

Manhattan plots of the genome-wide association study for chemerin levels without (A) or with (B) conditional analysis of the rs3735167 polymorphism. The general linear model was used to examine the association between single nucleotide polymorphisms and chemerin levels after adjustment for age, sex, body mass index, and current smoking status. The blue and red dashed horizontal lines revealed a $-\log_{10}(P \text{ value})$ of 8 and 6, respectively.

Supplementary Figure 2. Association between BMI and circulating chemerin levels in TWB population and patients with angiographically confirmed coronary artery disease (A, B); Association between BMI and tertiles of circulating chemerin levels were presented as Box and whisker plots analysis (C, D).

P value: Adjusted for sex, age and current smoking status. Abbreviations as in Table 1.

Supplementary Figure 3. Kaplan–Meier curves of the cumulative incidence of primary and secondary endpoints. Kaplan–Meier curves of the cumulative incidence of primary and secondary endpoints according to the rs3735167 genotypes. No significant difference was found between the rs3735167 genotype and long-term outcomes of CAD patients in the total study population (A, B) or in subgroups according to C-reactive protein (CRP) levels (C, D).
