

Fig. S1a: NMs internalization into 16HBE cells at 48h after treatment.

Same thresholds are applied and the percentage of SSC^{low} and SSC^{high} cells are represented here. (means ± S.E.M., n=3, ***P<0.001 (Welch t-test), as compared to the percentage of SSC^{low} of the control group, ###P<0.001 (Welch t-test), as compared to the percentage of SSC^{high} of the control group.)
