

Supplementary Figure 1.

We show the cell morphology of HT-29 cells after 24 h incubation with different *Allium sativum* extract concentrations (referred to alllicin content). In detail, 2.5×10^5 cells were seeded in 6-well plates, and each well was incubated during 24 h with different *Allium sativum* extract concentrations (0, 2.5, 5, 10, 25, 50, 75 and 100 µg/mL; referred to alllicin content). One representative image is shown for each condition. Scale bar = 100 µm.
