

1 Supplementary Figures

2

3 **Figure S1.** Alignment of the human RRAGC and zebrafish Rragc proteins. In zebrafish, there are two RRAGC
 4 orthologs, *rragca* and *rragcb*, encoding proteins that share 75% and 71% amino acid identity to the human RRAGC,
 5 respectively. S75 residue was indicated by an arrowhead and the P-loop motif was boxed.

Figure S2. *rragca* is more predominantly expressed than *rragcb* in zebrafish heart. Shown are RNA-seq analysis of 6-months-old adult zebrafish. RPKM, reads per kilobase per million reads.

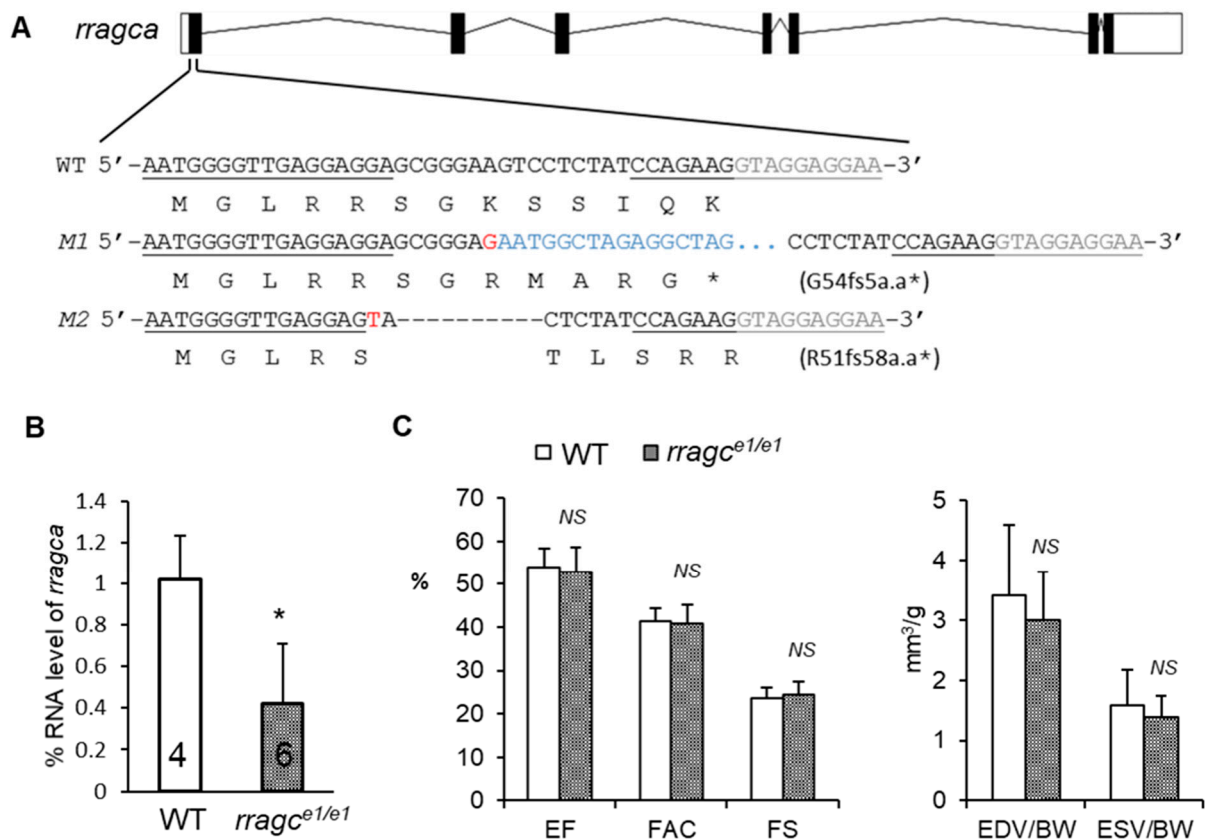

Figure S3. *rragca* knock outs do not manifest cardiac phenotypes. (A), Schematics of the 2 *rragca* mutant alleles generated using TALEN. The sequences in the 1st exon and intron (in grey color) that were targeted by the TALEN pairs are underlined. Dashed lines indicate deleted nucleotides; nucleotides in blue indicate insertional mutations; nucleotides in red indicate additional mutations. fs, frameshift. *, premature translational stop codon. (B), *rragca* transcript level is reduced in *rragce1/e1* fish hearts. Shown are RT-qPCR analysis of the M1 allele. Data were normalized to *actb2* and expressed as fold change over WT, n=4, 6, Student's t test. (C), *rragca* knock-outs exhibits normal cardiac function. Shown are echocardiographic measurements for WT and *rragce1/e1* fish at 1 year of age (n =10,11). EF, ejection function. FS, fractional shortening. EDV, end-diastolic volume. ESV, end-systolic volume. BW, body weight. All values are shown as means ± SD. *P<0.05 versus WT; NS, not significant versus WT by Student's t test.

A

B

Figure S4. Effects of mTOR inhibition on phenotypes of RagC S75Y cardiomyopathy. (A). Representative confocal images of NRVCMs infected with recombinant adenoviruses: Ad:GFP (CON) or Ad:RagC S75Y (RagC^{S75Y}) for 24 hours followed by rapamycin (100 nmol/L) or torin (10 nmol/L) or vehicle incubation for another 24 hours. Cells were stained with an anti-alpha-actinin antibody (red) and DAPI (blue). Scale bar, 20 μ m. (B). Zebrafish body weight of double mutants with their corresponding single mutants and wild type control at 3-month-old. N=19,18,9,15. Data are shown in boxplot (MIN to MAX). * P <0.05, NS, not significant versus *rragc* KI, one-way ANOVA.

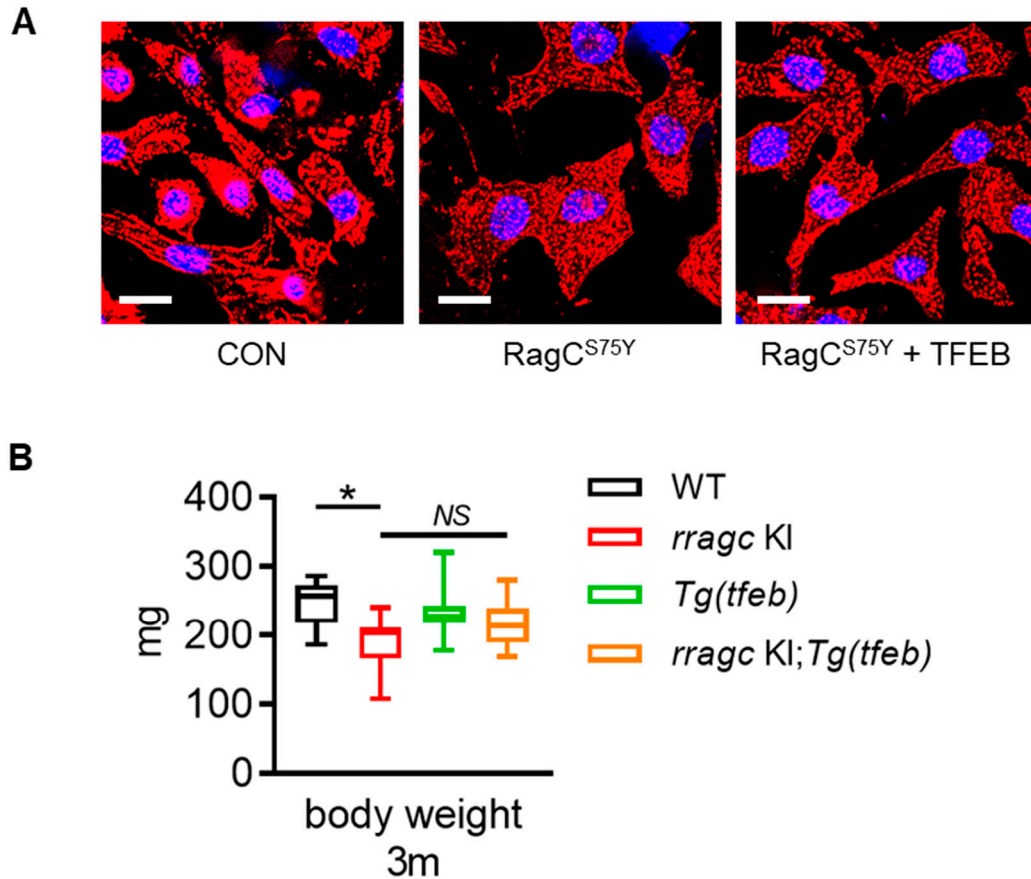

Figure S5. Effects of TFEB activation on phenotypes of RagC S75Y cardiomyopathy. (A). Representative confocal images of NRVCs infected with recombinant adenoviruses: Ad:GFP (CON), Ad:RagC S75Y (RagCS75Y) for 24 hours followed by rapamycin (100 nmol/L) or torin (10 nmol/L) or Ad:TFEB-FLAG (TFEB) for 48 hours. Cells were stained with an anti- α -actinin antibody (red) and DAPI (blue). Scale bar, 20 μ m. (B). Zebrafish body weight of double mutants with their corresponding single mutants and wild type control at 3-month-old. N=11,8,19,18. Data are shown in boxplot (MIN to MAX). * P <0.05, NS, not significant versus $rragc$ KI, one-way ANOVA.

Table S1. Primers for qPCR and genotyping

Gene	Forward	Reverse
<i>Primers for quantitative Real Time-PCR</i>		
<i>Nppa</i>	CAACACAGATCTGATGGATTCA	CCTCATCTTCTACCGGCATC
<i>Nppb</i>	GTCAGTCGCTTGGGCTGT	CAGAGCTGGGGAAAGAAGAG
<i>Mhc6</i>	AGTGCTTCGTGCCTGATGA	AACTTGGGTGGGTTCTGCT
