The experiments were performed using 2',7'-dichlorodihydrofluorescein diacetate (H₂DCFDA), a fluorescent indicator for ROS in cells. The fluorescence of stained cells was measured by flow cytometry. 2,2'-Azobis(2-amidinopropane) dihydrochloride (AAPH) was used as positive control. Results are presented as median intensity of fluorescence of 10000 events (n = 3). Statistically significant differences between the samples and respective controls are depicted by asterisks ($p < 0.05$; ** $p < 0.01$).
