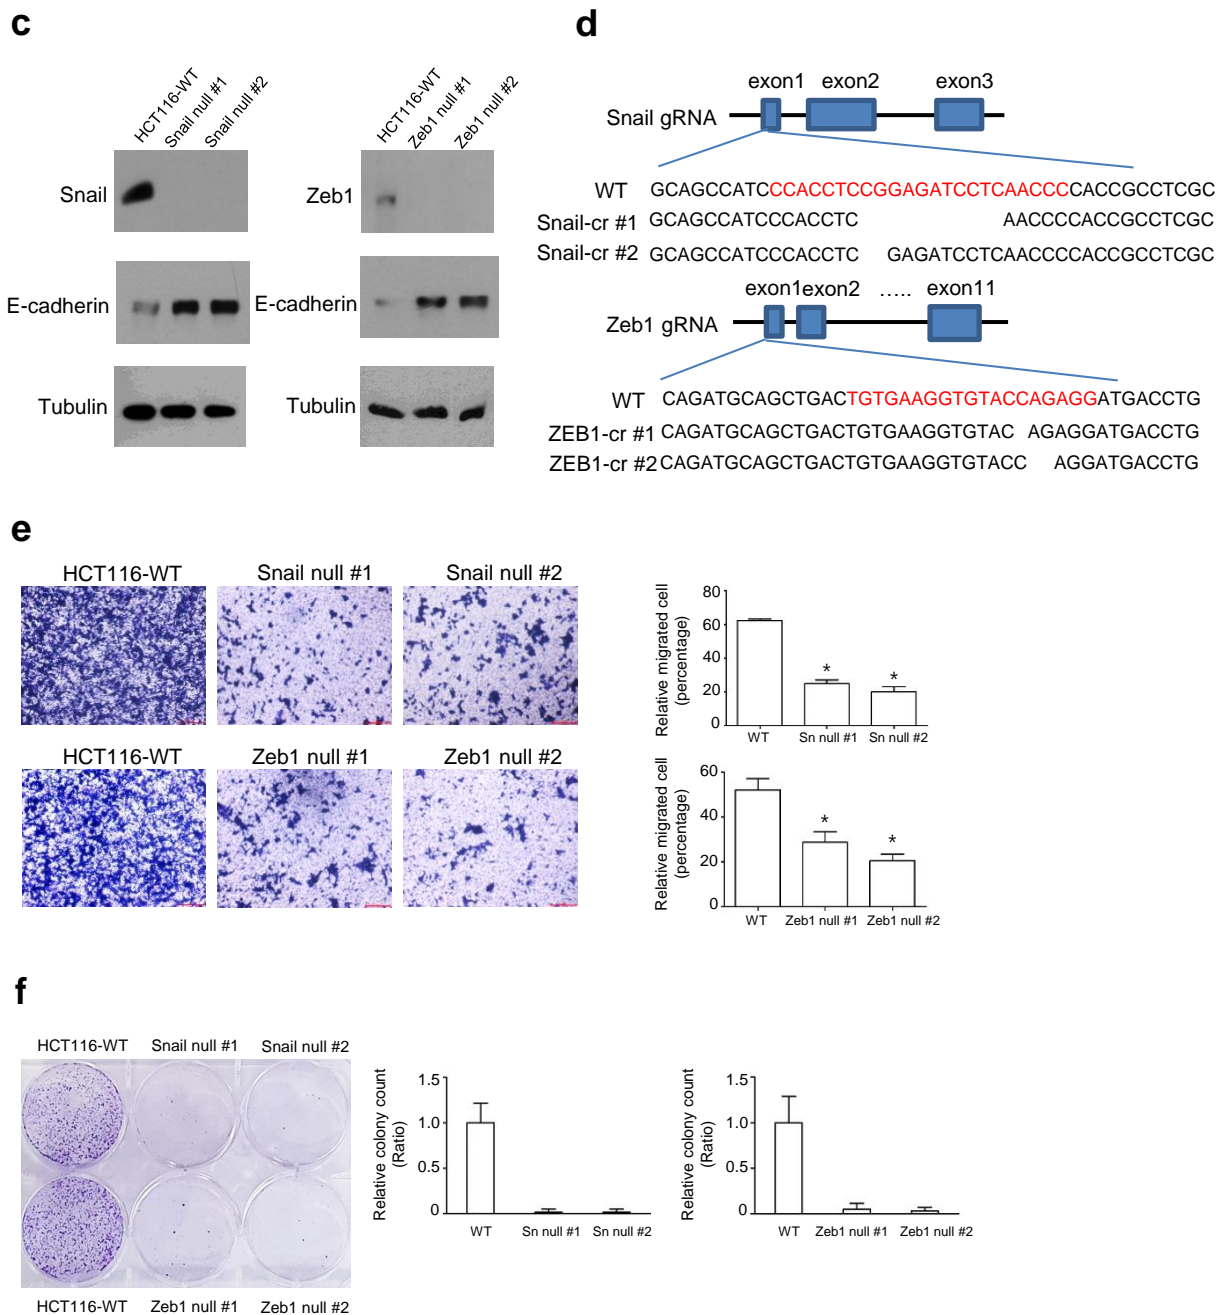

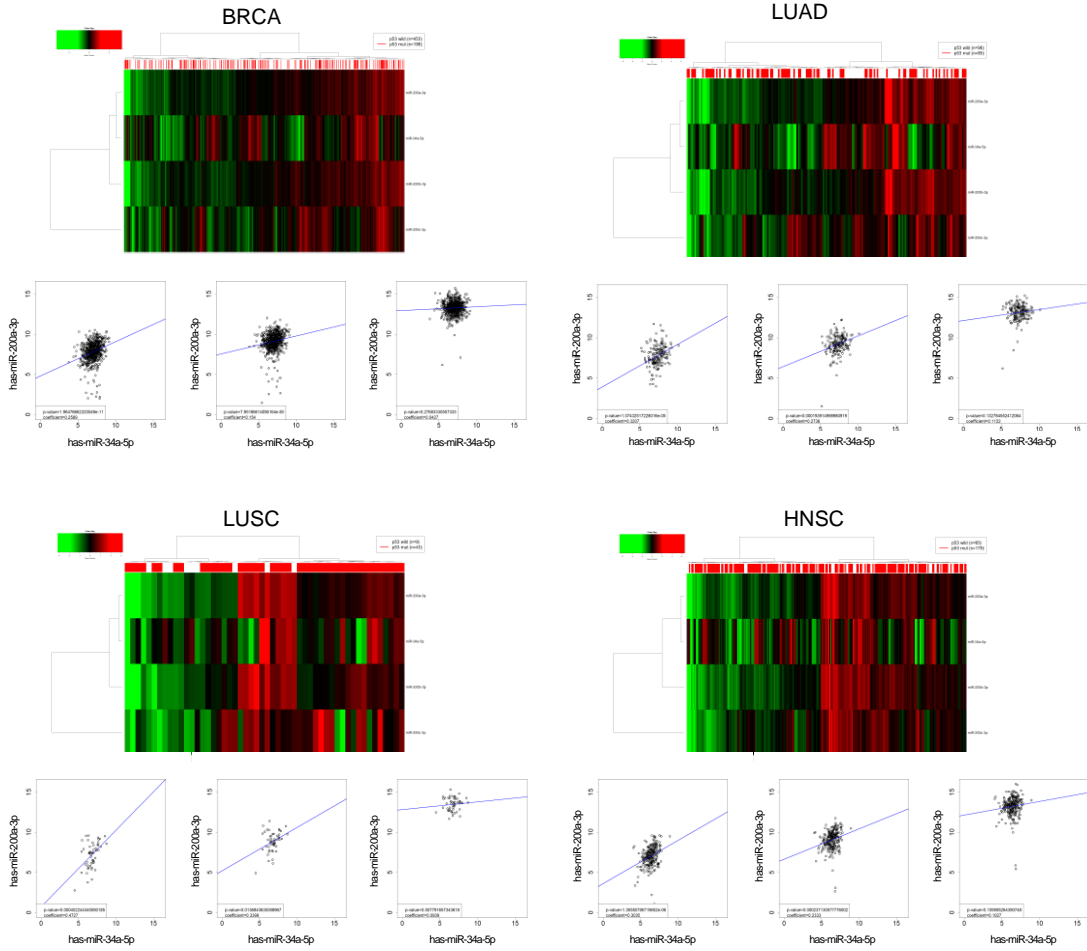

Figure S1. Reciprocal interaction between Snail and Zeb1:

(a) Survival rate of patients with different expression of Snail and Zeb1; (b) An supervised hierarchical clustering of genes associated with Snail and Zeb1 expression profiles in other type of cancers. In the heatmap, red denotes higher relative expression, whereas green indicates lower relative expression, with degree of color saturation reflecting the magnitude of the log expression signal; (c) Immunoblot analysis of Snail (Left panel), Zeb1 (Right panel) and E-cadherin (Both panel) in whole lysate, after respective knockout of Snail and Zeb1 in HCT116. Representative blots are shown from at least two independent experiments; (d) Schematic illustration of Snail1 and Zeb1 gene structure and target sequences around the target loci. The gRNA target sequences are indicated by red. The genomic sequences around the target sites of wild type (WT) and Snail CRISPR 1,2 cells. Knockout of Snail and Zeb1 decreases; (e) migratory activity and (f) drug resistance against taxol (* $p < 0.05$ compared with control, Mann-whitney test);

Figure S2. The correlation of miR-34a and miR-200 family in BRCA, LUAD, LUSC, and HNSC: An supervised hierarchical clustering based on miR-34a and miR-200 family expression profiles in other type of cancers. In the heatmap, red denotes higher relative expression, whereas green indicates lower relative expression, with degree of color saturation reflecting the magnitude of the log expression signal.
