## File preparation for GROMACS users

In this work, we prepared a database with a significant number of ready-to-use Gemini surfactants structures and topologies. Provided files are intended for NAMD software, however may be easily translated to fit GROMACS users. On that purpose we recommend using Python 2 tool made by Reza Salari called *PyTopol: A Library For Converting Molecular Topologies*. Further, we present a brief tutorial on how to deal with delivered NAMD force fields.

Firstly, ensure that you have Python 2.7 installed. You can clone the git repo or simply download it from the Reza Salari GitHub page <https://github.com/resal81/PyTopol/wiki/PyTopol-Installation> or use the pip installer. Afterward, copy desired topology files into the main PyTopol directory and use the following command to generate .top and .itp files.

```
psf2top.py -p psf_file.psf -c parameter_file.par
```

Further, comment redundant and overlapping headings in the .top file if needed. (in general first three lines, otherwise GROMACS will prompt when calling *gmx grompp* function). All the details and test section are available on the GitHub page.
