

Figure S5. mRNA stability of hEPO and hEPO-Stab.

Stably transfected CHO-K1 cells expressing hEPO or hEPO-Stab proteins were induced by doxycycline treatment for 20 h. Cultures were grown for 2 h in doxycycline-free medium to allow to decline the transcription of the transgenes and further incubated in doxycycline-free medium for 0-4-7-10 hr. At the indicated time points total RNA was prepared and the hEPO or hEPO-Stab mRNA levels were measured by qRT-PCR. In all qPCR experiments the relative transcript levels were normalized to actin.
