3. The decay mode of EP \rightarrow ZP and ZP \rightarrow EP photoisomerization processes of LDMRM DDPY

As we can see in Figure S3, the natural logarithm of S_1 time-dependent fractional occupation at 50 K, 100 K, 200 K and 300 K can be fitted by two straight lines. *I.e.*, the decay modes of molecular motor DDPY for the EP \rightarrow ZP photoisomerization process are bi-exponential at different temperature.

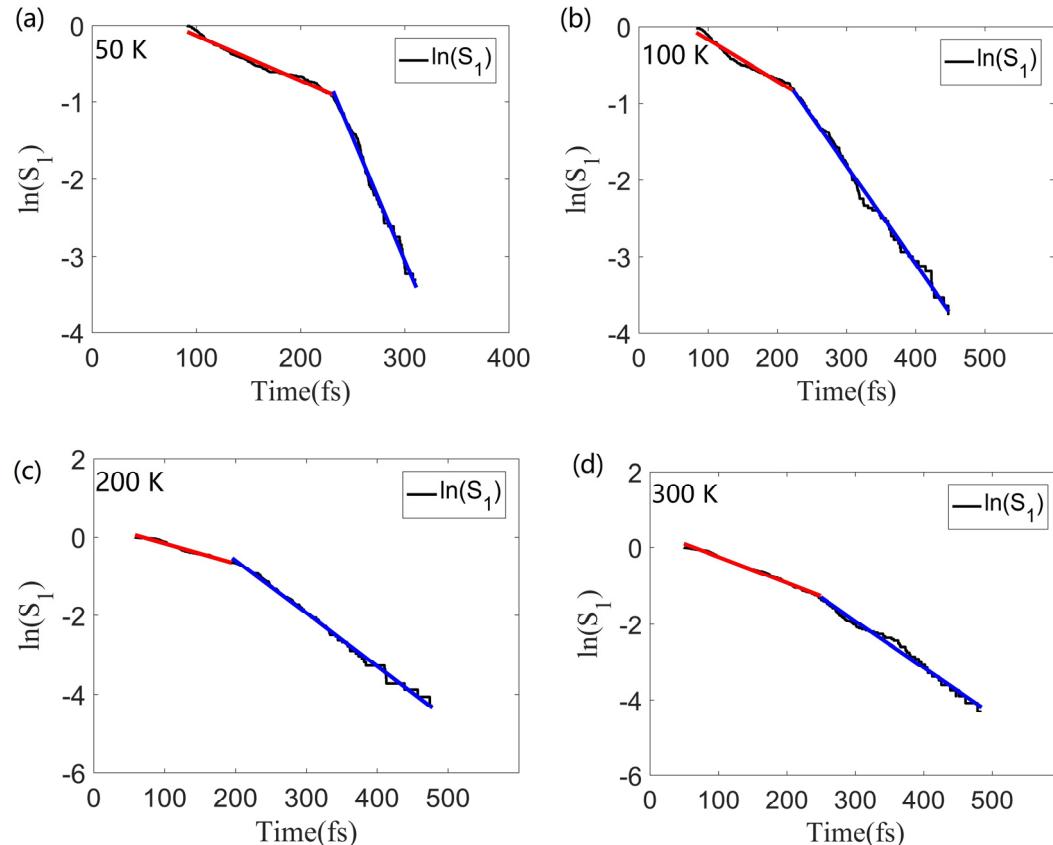

Figure S3. The average occupation of the S_1 excited state over time in the EP \rightarrow ZP photoisomerization process of molecular motor DDPY fitted by bi-exponential functions at (a) 50 K, (b) 100 K, (c) 200 K and (d) 300 K, respectively.

After taking a numerical derivative on the occupation of S_0 state over time at 50 K, 100 K, 200 K and 300 K, respectively, as can be seen in Figure S4, some of the peaks decrease or even disappear as the temperature decreasing. So the decay mode of molecular motor DDPY for the $ZP \rightarrow EP$ photoisomerization process are all periodic at different temperature.

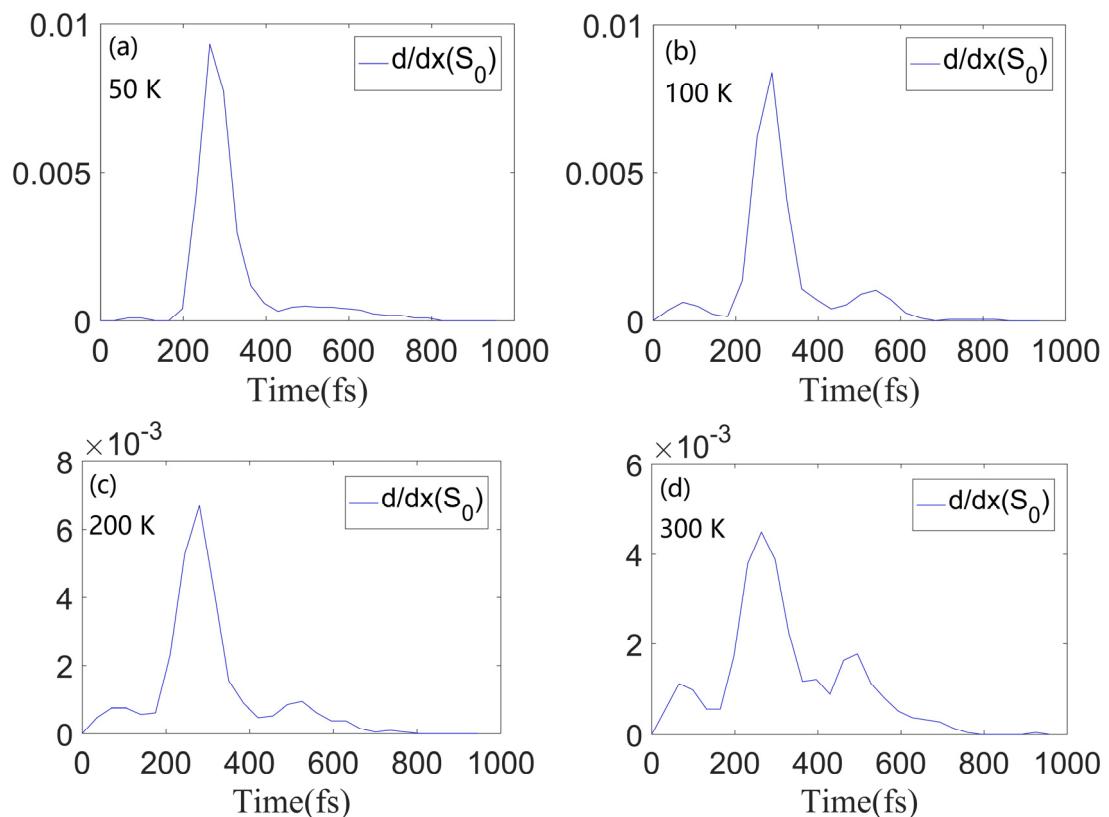

Figure S4. The first derivative of the S_0 population over time in the $ZP \rightarrow EP$ photoisomerization process of molecular motor DDPY at (a) 50 K, (b) 100 K, (c) 200 K and (d) 300 K, respectively.

The corresponding points of ground state EP isomer, conical intersection ECI(1), ECI(2), ZCI(1) and ZCI(2) are also presented in this figure.
