

## Supplemental Figures and Tables

**Supplemental Figure S1. Female and male mice did not exhibit significant differences in TMEV-induced clinical signs during the acute phase of viral infection.** Data shown here are the mean  $\pm$  SEM of the average clinical phenotype frequency for each strain with 4 and 14 dpi timepoints being pooled. P values were determined using the Wilcoxon rank sum tests \*,  $P < 0.05$ ; \*\*,  $p < 0.01$ ; \*\*\*,  $P < 0.001$ .

**Supplemental Figure S2. Cross sections of the hippocampal formation at level B of**

**C57BL/6J mice infected with Theiler's Murine Encephalomyelitis Virus (TMEV). A, B, C.**

Sham mouse. A. Normal hippocampal formation. H&E stain. B. Iba-1 immunolabeling. This

image has black clumps from the automated stainer over the tissue, which were interpreted as

artifact. C. RNA *in situ* hybridization for TMEV with lack of mRNA nuclear expression. D, E, F.

Infected mouse euthanized at 4 dpi. D. Neuroparenchymal gliosis and perivascular cuffing of the

stratum radiatum, stratum lacunosum-moleculare and stratum oriens with mild neuronal necrosis

of CA2 pyramidal layer. H&E stain. E. Across the hippocampal formation the glial reaction and

perivascular cuffing in D corresponded to Iba-1 immunolabeling. F. TMEV mRNA expression

was located in the hippocampal formation and in the retrosplenial area of the cortex. G, H, I. Infected mouse euthanized at 14 dpi. G. Locally extensive neuronal necrosis and loss of CA1, focal neuronal necrosis and loss of CA2 pyramidal layers with marked gliosis and perivascular cuffing of stratum radiatum, stratum lacunosum-moleculare and stratum oriens. H. Across the hippocampal formation the glial reaction and perivascular cuffing in G corresponded to strong Iba-1 immunolabeling. I. TMEV mRNA expression was mostly cleared by 14 dpi and was located at field CA2. Bar=200  $\mu$ m.
