**Figure S1. Multiple alignment of *Acucp* complete coding sequence, sequence annotated as XM\_004334150.1 and genomic DNA (NW\_004457290). Matching genomic and cDNA sequences encoding AcUCP. The figure shows all five introns according to genomic sequence (NW\_004457290: 13506..14912) highlighted in blue and one additional intron not yet annotated in XM\_004334150.1 in red.**

**Figure S2. The phylogenetic relationships of MACPs with highest homology to UCPs.**

The results were obtained by Maximum Likelihood method and JTT matrix-based model. The tree with the highest log likelihood (-24952.29) is shown. This analysis involved 85 amino acid sequences. There were 537 positions in the final dataset. Evolutionary analyses were conducted in MEGA11.

**Figure S3 A. Schematic diagram of cloning strategy used to obtain *Acanthamoeba castellanii* uncoupling protein (AcUCP) coding sequence.** RT-PCR using the 3' RACE and GSPF1 primers provided an approximately 800 bp fragment confirmed by GSPF2 and 3' RACE nested primers. The GSPRev1 and GSPRev2 primers allowed sequence extension using the 5' RACE primer and the nested 5' RACE primer in the same manner. It enabled design of primers for the entire sequence. (RACE, rapid amplification of cDNA ends.) **B. AcUCP coding sequence with the specific primers used in the RACE technique highlighted.** Sequencing of the resulting 3' RACE and 5' RACE products enabled the assembly of the entire coding sequence.

## Supplementary materials: cloning to pYES2

**The cloning of complete AcUCP protein coding sequence with N-His tag and C-His tag or without any tags into pYES2 yeast expressing vector with Vazyme ClonExpress II One Step Cloning system.**

The Vazyme ClonExpress II One Step Cloning system (Vazyme Biotech Co.) enables directional insertion of any amplified DNA product into any linearized vector at any site, provided that there are overlapped sequences of 15 bp - 20 bp on both 5'- and 3'- ends.

Experimental procedure consists of the following steps:

1. PCR for 954-bp *Acucp* CDS amplicon was performed using Q5 Hot Start High Fidelity kit (New England Biolabs) according to manufacturer's instructions with primers AcUCP fd: 5'ATGTCTGCAGGGAAGCGCA3' and AcUCP rev: 5'CTAGTGCTTCTCGACGACCC3'. The applied thermal cycling conditions consisted of an initial denaturation at 98°C for 1 min followed by 35 cycles at 98°C for 10 s, 68°C for 15 s, 72°C for 20 s, and ending incubation at 72°C for 2 min. The PCR product was purified using QIAquick PCR Purification Kit (Qiagen) per the manufacturer's instructions.
2. Overhang PCRs
  - a. Overhang PCR for adding of vector sequences to *Acucp* CDS amplicon to produce UCPexp amplicon was performed using Q5 Hot Start High Fidelity kit (New England Biolabs) according to manufacturer's instructions.  
Primer pair used for UCPexp amplicon: FducexpYES2 (5'-TTGGTACCGAGCTCGGATCCATGTCTGCAGGGAAGCGCA-3') and RevucexpYES2 (5'-GATGGATATCTGCAGAAATTCCTAGTGCTTCTCGACGACCC-3'). The applied thermal cycling conditions consisted of an initial denaturation at 98 °C for 2 min followed by 35 cycles at 98°C for 10 s, 72°C for 45 s and ending incubation at 72°C for 2 min. The PCR product was purified using QIAquick PCR Purification Kit (Qiagen) according to the manufacturer's instructions.

- b. Overhang PCR1 for adding of His-tag, Gly linker and vector sequences to *Acucp* CDS amplicon to produce UCP His-N/C amplicons was performed using Q5 Hot Start High Fidelity kit (New England Biolabs) according to manufacturer's instructions.
  - i. For amplification of sequence encoding AcUCP tagged with six histidine residues at the N-terminus to produce UCP\_His-N amplicon was used primer pair: AcucpHF (5' GAGCTCGGATCCATGCATCATCACCATCACCACGGAGGTGGAATGTCTGCAGGGAAGCGCA 3') and Acucpecr (5' CCGGAATTCCTAGTGCTTCTCGACGACCC 3'). The applied thermal cycling conditions consisted of an initial denaturation at 98°C for 1 min followed by 5 cycles at 98°C for 10 s, 72°C for 15 s, 72°C for 35 s, then 30 cycles at 98°C for 10 s, 70°C for 15 s, 72°C for 35 s, and ending incubation at 72°C for 2 min. The PCR product was purified using QIAquick PCR Purification Kit (Qiagen) as per the manufacturer's instructions.
  - ii. For amplification of sequence encoding AcUCP tagged with six histidine residues at the C-terminus to produce UCP\_His-C amplicon primer pair used was: Acucpbaf (5' GCGGGATCCATGTCTGCAGGGAAGCGCA 3') and AcucpHR (5' CTGCAGAATTCTTAGTGGTGATGGTGATGACCTCCACCGTGCTTCTCGACGACCCGT 3'). The applied thermal cycling conditions consisted of an initial denaturation at 98°C for 1 min followed by 5 cycles at 98°C for 10 s, 72°C for 15 s, 72°C for 35 s, then 30 cycles at 98°C for 10 s, 70°C for 15 s, 72°C for 35 s, and ending incubation at 72°C for 2 min. The PCR product was purified using QIAquick PCR Purification Kit (Qiagen) as per the manufacturer's instructions.
- c. Overhang PCR2 for extension of vector sequences in UCP\_His-N or UCP\_His-C amplicon to produce UCP\_His-N2/C2 amplicons was performed using Q5 Hot Start High Fidelity kit (New England Biolabs) according to manufacturer's instructions.
  - i. For UCP\_His-N2 amplicon, primer pair used: AcucpHF2 (5' CTTGGTACCGAGCTCGGATCCATGCATCA 3') and Acucpecr2 (5' TGATGGATATCTGCAGAATTCCTAGTGCTTCTCGACGA 3'). The applied thermal cycling conditions consisted of an initial denaturation at 98°C for 1 min followed by 5 cycles at 98°C for 10 s, 67°C for 15 s, 72°C for 35 s, then 30 cycles at 98°C for 10 s, 72°C for 35s, and ending incubation at 72°C for 2 min. The band of PCR product excised from agarose was purified using the Monarch DNA Gel Extraction Kit (New England BioLabs) and QIAquick PCR Purification Kit (Qiagen) per the manufacturer's instructions.
  - ii. For UCP\_His-N2 amplicon, primer pair used: Acucbaf2 (5' CTTGGTACCGAGCTCGGATCCATGTCTGCAGGGAA 3') and AcucpHR2 (5' TGATGGATATCTGCAGAATTCCTTAGTGGTGATGG 3'). The applied thermal cycling conditions consisted of an initial denaturation at 98°C for 1 min followed by 5 cycles at 98°C for 10 s, 66°C for 15 s, 72°C for 35 s, then 30 cycles at 98°C for 10 s, 70°C for 15 s, 72°C for 35 s, and ending incubation at 72°C for 2 min. The excised from agarose band of PCR product was purified using the Monarch DNA Gel Extraction Kit (New England BioLabs) and QIAquick PCR Purification Kit (Qiagen) according to the manufacturer's instructions.
3. The pYES2 vector (ThermoFisher Scientific) was prepared for cloning by its digestion with restriction enzymes at the cloning site. Restriction of pYES plasmid with BamHI-HF (New England Biolabs) and EcoRI-HF (New England Biolabs) was carried out according to restriction enzyme manufacturer's instructions. Purification of digested plasmid (vector backbone) was carried out using QIAquick PCR Purification Kit (Qiagen) according to manufacturer's instructions.
4. The cloning was performed using ClonExpress II One Step Cloning kit (Vazyme Biotech Co.) according to manufacturer's instructions. The purified preparations of the linearized vector and UCPexp, UCP\_His-N2 or UCP\_His-C2 amplicon were used for recombination to yield pYES2+*Acucp*, pYES2+N-*HisAcucp*, pYES2+C-*HisAcucp* vector, respectively.
5. Transformations of competent DH5α *E.coli* cells with recombinant vectors were performed using standard procedure.

6. *Colony PCR to screen for positive transformants* was carried out on *ampicillin-selected clones* lysed by boiling. Reaction was performed using 5x HOT FIREPol Blend Master Mix (Solis BioDyne OÜ) and vector-specific primer pair: YESfor (5' CGGATCGGACTACTAGCAG 3') and Cyc1rev (5' GTGAATGTAAGCGTGACATAAC 3'). The applied thermal cycling conditions consisted of an initial denaturation at 98°C for 12 min followed by 35 cycles at 98°C for 10 s, 54°C for 15 s, 72°C for 75 s, and ending incubation at 72°C for 5 min.
7. Isolations of successfully recombinant plasmids was carried out using 12 mL overnight *E. coli* DH5alpha liquid cultures and the Pasmid Mini AX kit (A@A Biotechnology) according to manufacturer's instructions.
8. DNA sequencing of some chosen colony PCR products and then of isolated plasmid were performed to validate target recombinants.
9. DNA sequencing was undertaken using the ABI Prism Big Dye Terminator Sequencing Kit version 3.1 (Applied Biosystems, Foster City, CA, USA). Cycle sequencing was performed in 20 µl reaction volume containing appropriate amount of DNA template and 1.5 pmole of primer, using the kit supplier's recommended thermal profile in a 2720 Thermal Cycler. After purification of the extension products by ethanol/EDTA precipitation method the DNA sequence was read by capillary electrophoresis performed in an ABI Prism 3130XL Genetic Analyser (Applied Biosystems, Foster City, CA, USA).
10. Sequence Scanner software v2.0 (Applied Biosystems) was used to check chromatograms and to control the data quality. Assembly of the sequence reads to generate consensus sequence and to compare it to a known reference sequence was performed using CodonCode Aligner software v10.0.2 (CodonCode Corporation).
