

Figure S1. Gating strategy for mice splenocyte populations 6 weeks post-immunization. T-lymphocytes were selected from a forward scatter height vs side scatter-height dot plot, and single cells were subsequently selected in a forward scatter-area vs forward scatter height dot plot. From living cell population, T cells were selected by CD3⁺ expression and CD8⁺ cytotoxic and CD4⁺ helper T cells were identified by a CD8 vs CD4 dot plot. From each population, effector or central memory T cells were identified by a CD44 vs CD62L dot plot. (*Tcm*: T central memory cells; *EM*: effector memory).
