

Figure S2. Association of *TERT* mRNA expression with the target tissue specific metastasis-free survival of human breast cancer patients. Kaplan-Meier analyses of the bone metastasis-free survival, brain metastasis-free survival and survival free of metastasis to distant lymph nodes in unselected patients (top row; $n=106$), estrogen receptor (ER) positive patients (second row; $n=55$), ER negative patients (third row; $n=51$), and triple negative patients (bottom row; $n=27$) are shown. Numbers (n) of patients in each group and p -values (p) are indicated. *TERT* high, *TERT* expression above the median of the study population ($n=106$); *TERT* low, relative *TERT* expression below the median.
