

Figure S1. Cytokinin binding sites on CK-responsive genes.

The scheme draw the position of CK binding sites in the 1500 bp region upstream the start codon (arrows) of genes used as CK-responsive markers. The binding sites included the experimentally-determined extended (ECRM; blue) and core (CRM; light blue) motifs [38], and octameric sequences (yellow/orange/brown) which were found enriched in promoters of CK-responsive genes [39].
