

Figure S1. Regulation of ferroportin levels in monocytes by secreted hepcidin activity. THP-1 cells were cultured in the absence (–Fe, control medium) or presence of P19 cell-conditioned medium, either non-stimulated or stimulated to secrete hepcidin. Representative blots identify protein levels using antibodies to ferroportin (α -FPN, upper panels) and glyceraldehyde-3-phosphate dehydrogenase (α -GAPDH, lower panels). Representative samples included in Figure 2A are denoted with an asterisk (*).
