Figure S1. Boxplots of amino acids amounts for *Epipactis helleborine* natural (nPOG1, nPOG2, and nZAB) and anthropogenic (aBIA, aCAR, aGON, aSOS, and aSUR) populations. Colored dots are individual samples. The crossed square shows the mean. The lower and upper hinges correspond to the lower (Q_1) and upper (Q_3) quartiles. Thus box length shows the interquartile range (IQR). The thicker line inside boxes corresponds to the median. The lower whisker extends from the hinge to the smallest value at most $Q_1 - 1.5 \times \text{IQR}$ of the hinge. The upper whisker extends from the hinge to the largest value no further than $Q_3 + 1.5 \times \text{IQR}$. Data beyond the end of the whiskers, indicated with an asterisk symbol, are outliers.

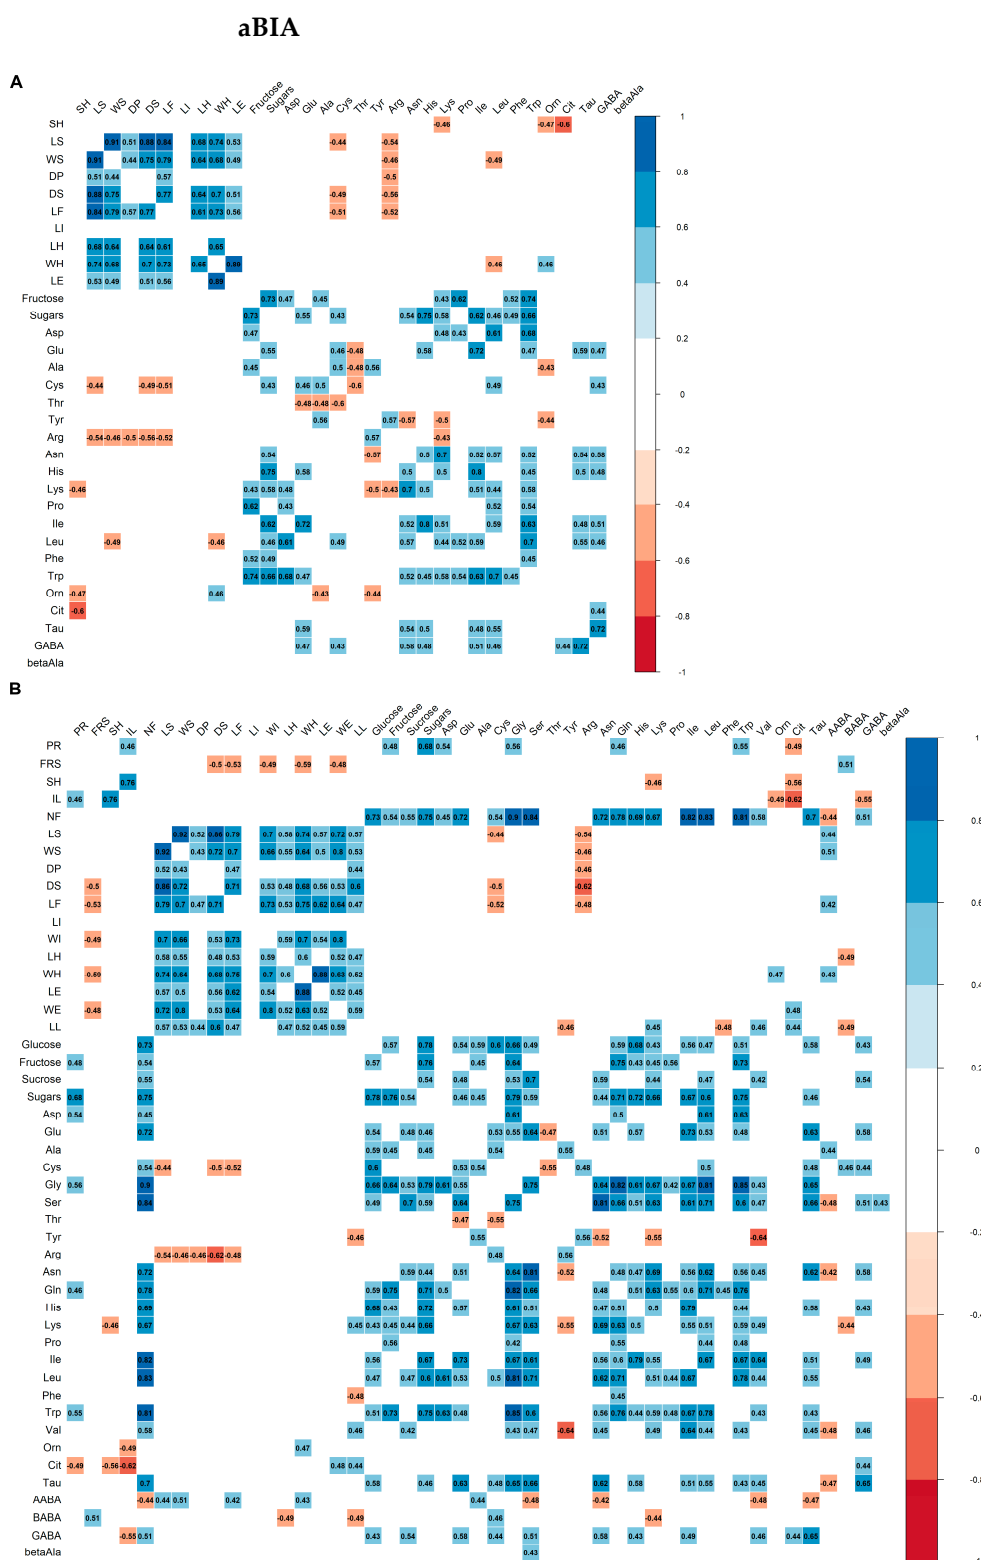

Figure S2. Correlation heatmap for reproductive success (that is, pollinaria removal, PR, and female reproductive success, FRS), floral display (that is, SH, IL, and NF), flower structures (that is, LS, WS, DP, DS, LF, LI, WI, LH, WH, LE, WE, and LL), and nectar composition (that is, sugars and amino acids) of *Epipactis helleborine* populations. Significant positive correlations are colored blue, while negative correlations are colored red ($p < 0.05$). Insignificant correlations are omitted. **A.** The colored and labeled scale codes show the value of (A) the Pearson rank correlation coefficient (r) and (B) the Spearman rank correlation coefficient (r_s). The abbreviations are explained in Table 1.
