Abstract: *Ganoderma* is a genus of wood degrading mushrooms with medicinal importance. Most of *Ganoderma* species have been studied extensively for their secondary metabolites, biological activities and ecological value. In this study, biological activities of the extracts of *G. adspersum*, growing wild on *Morus alba* tree in the region of Western Thrace (Greece) have been evaluated, as well as the petroleum ether, dichloromethanolic and methanolic extracts were studied further for their secondary metabolites. So far, six substances have been isolated by chromatographic (C.C, HPLC) and spectroscopic methods (NMR), which were classified in the following categories a) unsaturated fatty acid: cis-oleic acid (**1**), b) sterols: ergosta-7,22-dien-3-one (**2**), ergosta-7,22-dien-3-ol (**3**), ergosta-5,7,22-trien-3-ol (**4**) and c) lanostane-type triterpenoids: applanoxidic acid G (**5**) and applanoxidic acid A (**6**). Finally, the biological activities of the extracts were estimated for their antioxidant, anti-microbial and cytotoxic potent. The methanolic extract of *G. adspersum* shows the highest total anti-oxidant activity. The results of the antimicrobial activities indicate that all the extracts had a range of minimum inhibitory concentration (MIC) between 39.1-312.5 µg/mL. The evaluation of cytotoxic activity of the samples showed once again that the methanolic extract was the most potent among the examined extracts with half-maximal inhibitory concentration (IC₅₀) 19.22 µg/mL (Hep2c cells), 32.9 µg/mL (RD cells), 8.94 µg/mL (L2OB cells), respectively. Moreover, bioactivity score of the isolated secondary metabolites were calculated by online computer software program Molinspiration. Compounds showed promising bioactivity scores for drug targets.

Keywords: *Ganoderma adspersum*; sterols; lanostane type acids; *in silico*; nuclear receptor; cytotoxicity
