

SUPPLEMENTARY MATERIAL

Long-chain alkylthio cyclodextrin derivatives for modulation of quorum-sensing-based bioluminescence in *Aliivibrio fischeri* model system

Éva Fenyvesi, Zsófia Berkl, Laura Ligethy, Ildikó Fekete-Kertész, Márton Csizmazia, Milo Malanga, István Puskás, Levente Szőcs, Róbert Iványi, István Kese, Erzsébet Varga, Lajos Szente, Mónika Molnár

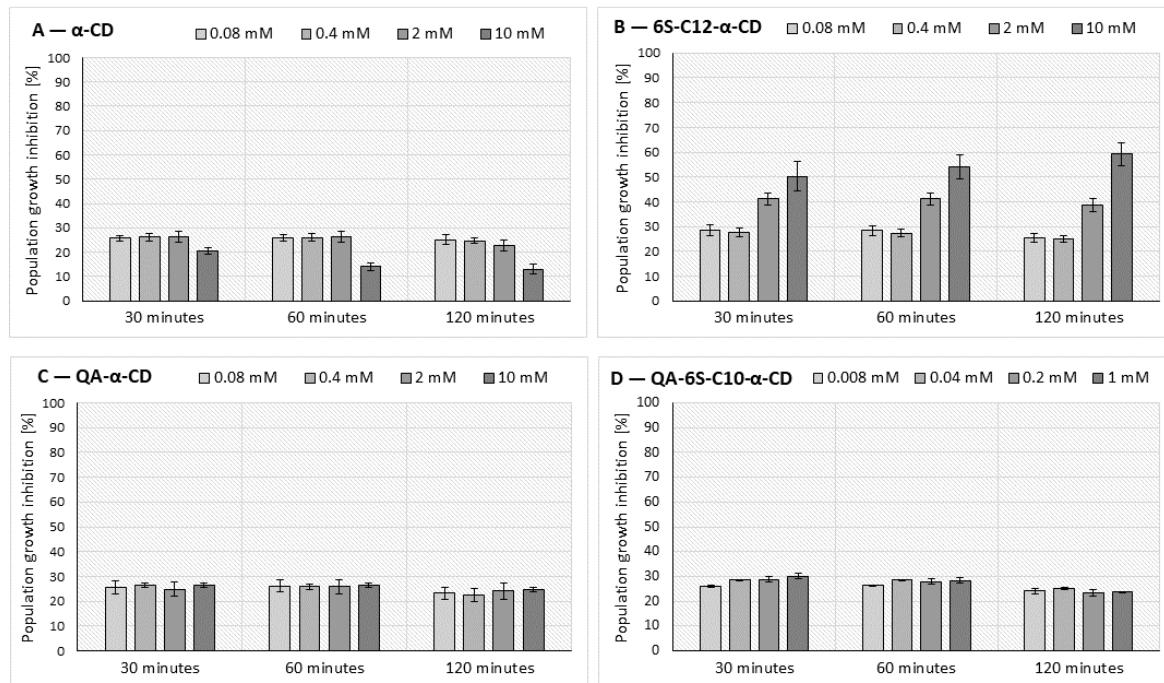

Figure S1. Effect of α -CD (A), 6S-C12- α -CD (B), QA- α -CD (C), and QA-6S-C10- α -CD (D) on the population growth of the *A. fischeri* after 30, 60, and 120 minutes of exposure. Data represent averages of four replicates.

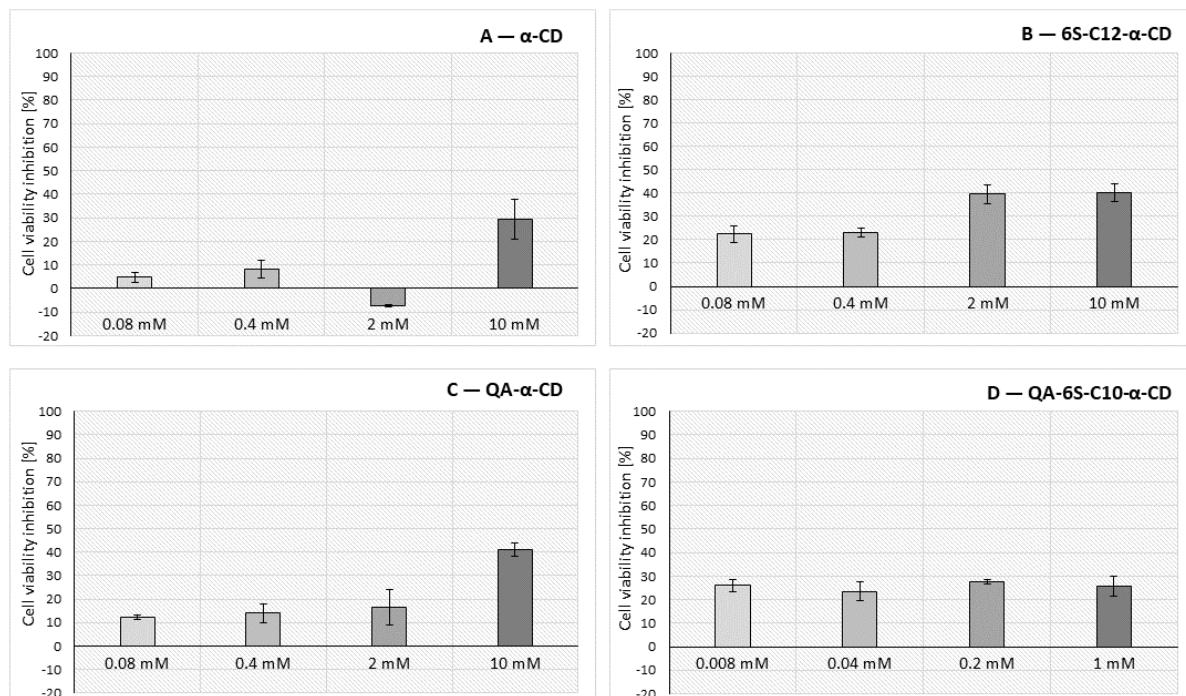

Figure S2. Effect of α -CD (A), 6S-C12- α -CD (B), QA- α -CD (C), and QA-6S-C10- α -CD (D) on the cell viability of the *A. fischeri* after 120 minutes of exposure. Data represent averages of four replicates.

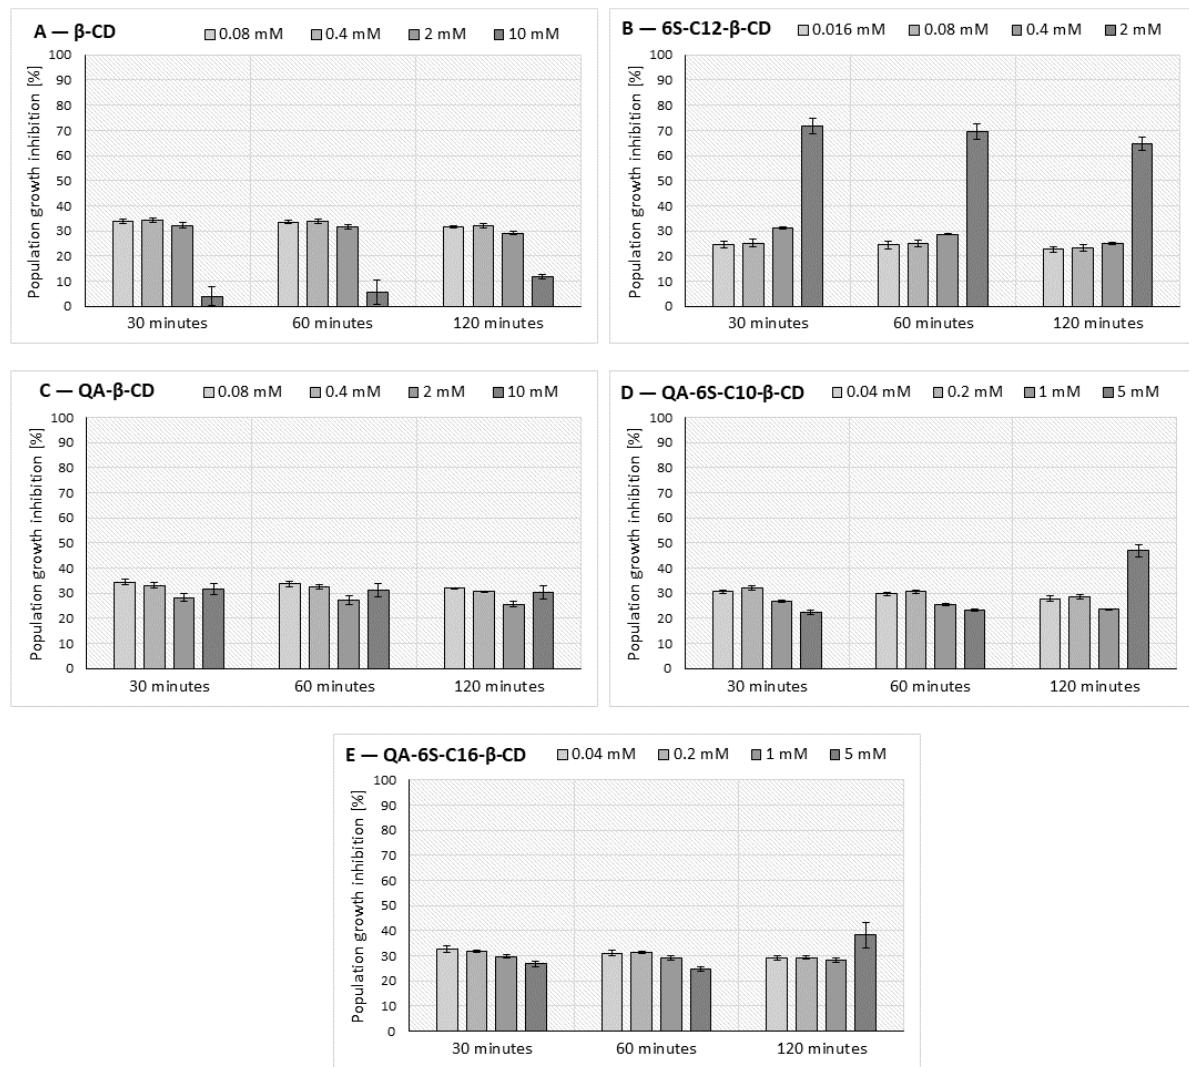

Figure S3. Effect of β -CD (A), 6S-C12- β -CD (B), QA- β -CD (C), QA-6S-C10- β -CD (D), and QA-6S-C16- β -CD (E) on the population growth of the *A. fischeri* after 30, 60, and 120 minutes of exposure. Data represent averages of four replicates.

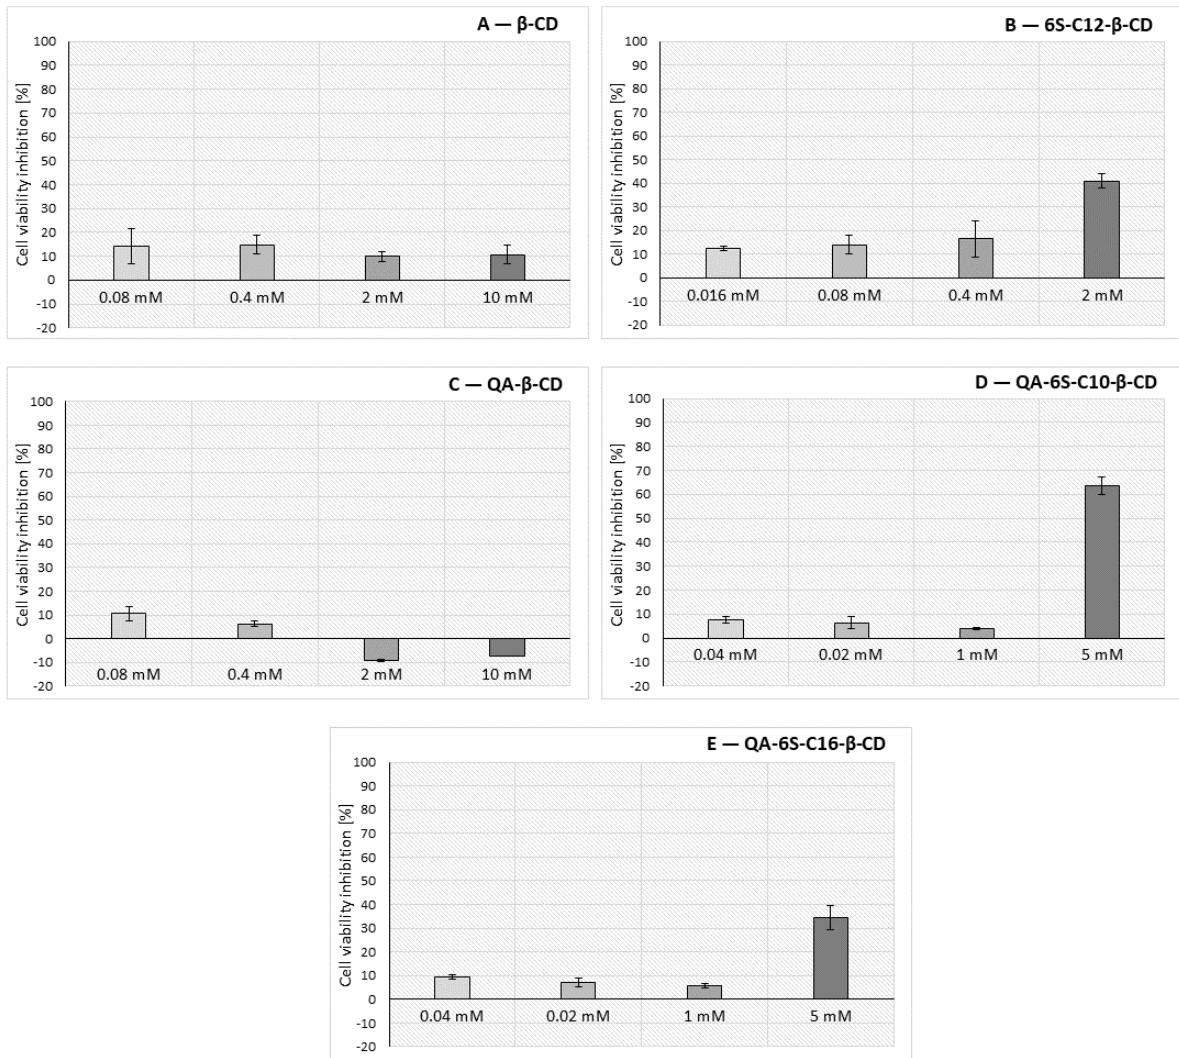

Figure S4. Effect of β -CD (A), 6S-C12- β -CD (B), QA- β -CD (C), QA-6S-C10- β -CD (D), and QA-6S-C16- β -CD (E) on the cell viability of the *A. fischeri* after 120 minutes of exposure. Data represent averages of four replicates.
