**Figure S1** Primary root bending rate of pea under different treatments at different times

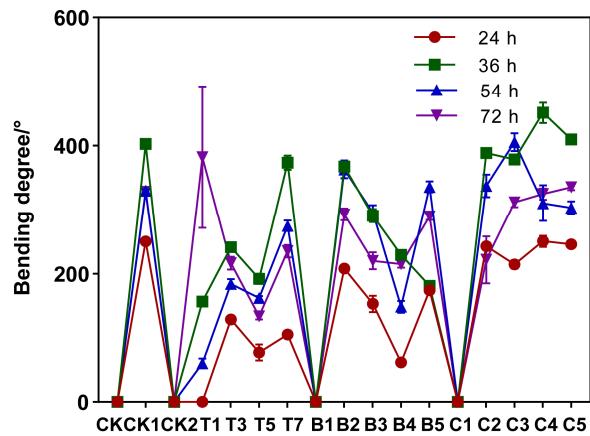

Figure S2 Pea primary root bending degree under different treatments at different times

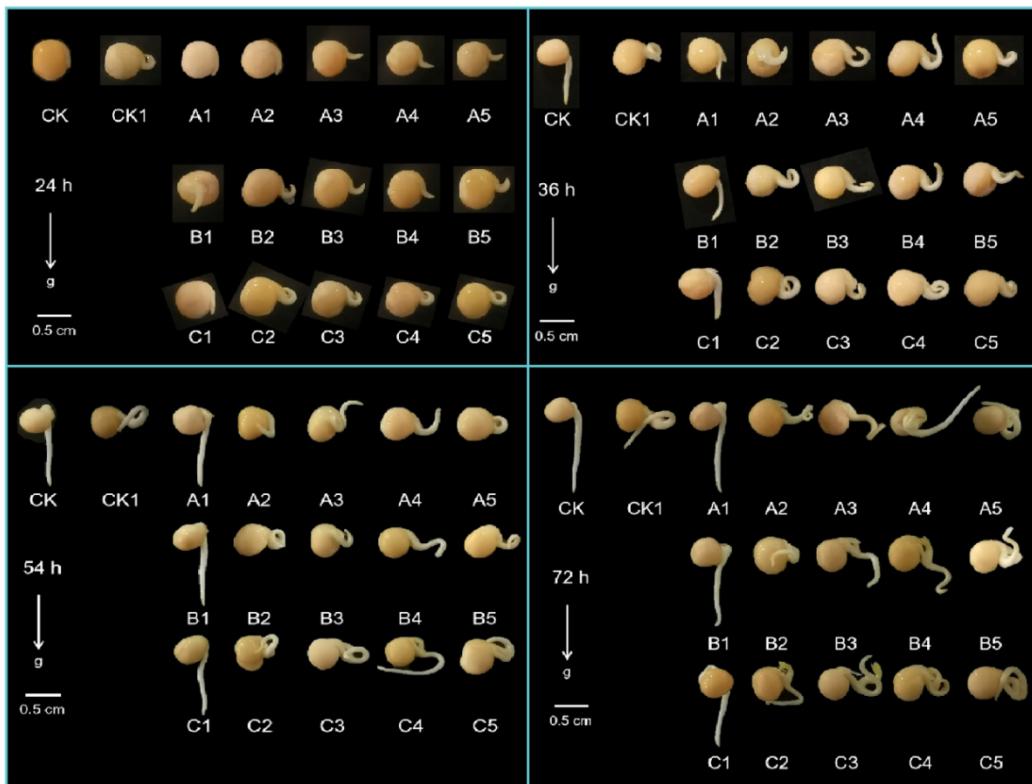

Figure S3 Growth status of pea primary roots under different treatments at 24 h, 36 h, 54 h and 72 h time intervals

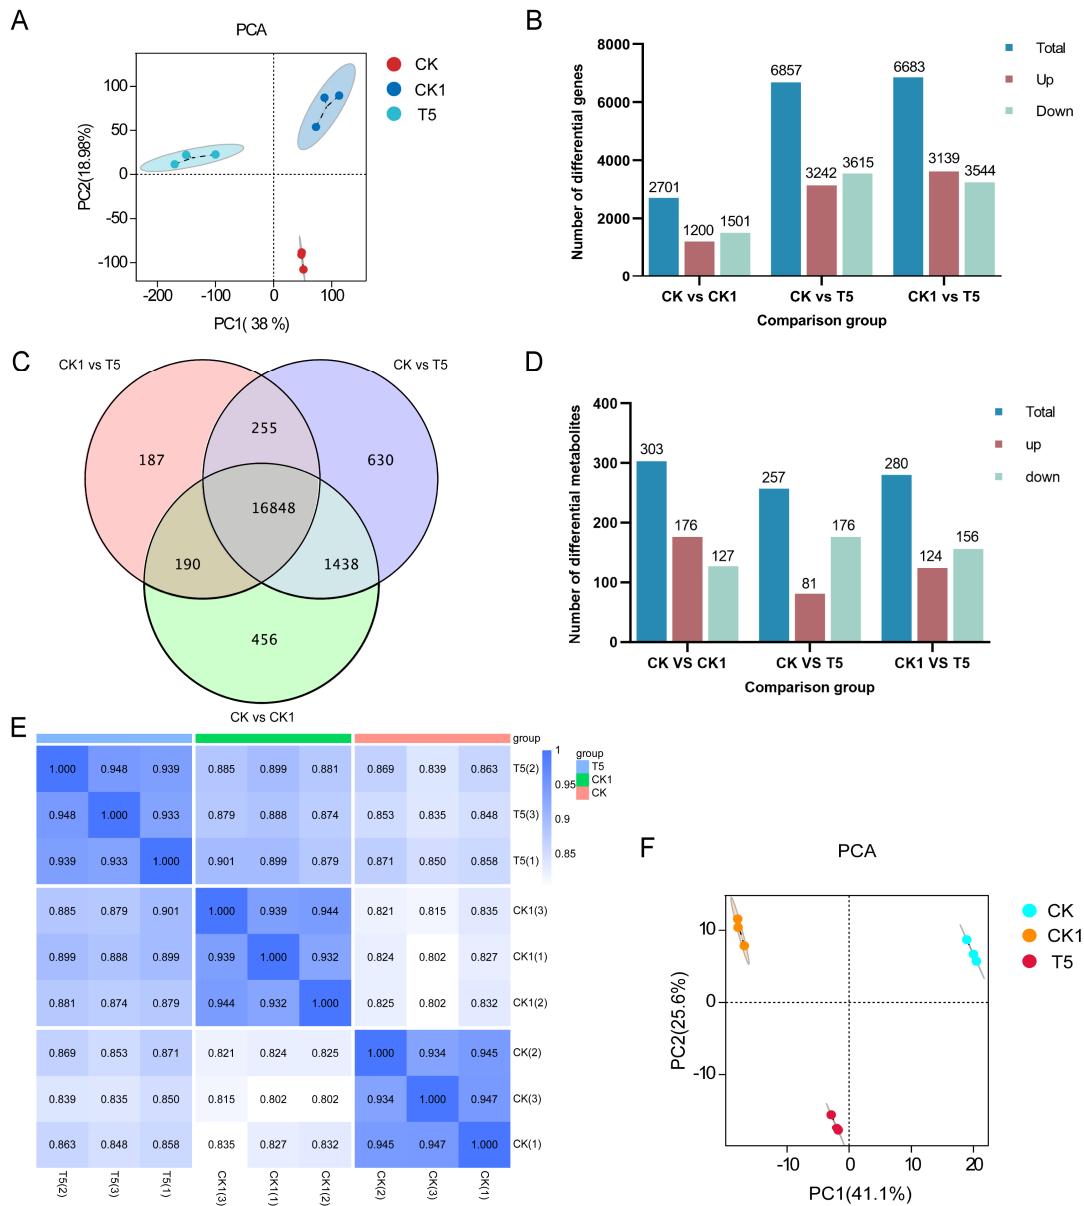

Figure S4 Overall transcriptome and metabolome analysis

(A) Principal component analysis (PCA) of differentially expressed genes (DEGs) in CK, CK1, and T5 treatment groups. (B) Number counts of DEGs. (C) Venn diagram (Venn) of DEGs. (D) Number statistics of differential accumulation metabolites (DAMs). (E) Correlation analysis of DAMs. (F) PCA analysis of DAMs. CK: water only, CK1: 150 mmol L⁻¹ H₂O₂, T5: 150 mmol L⁻¹ H₂O₂+10 mmol L⁻¹ CaCl₂, the same as below.

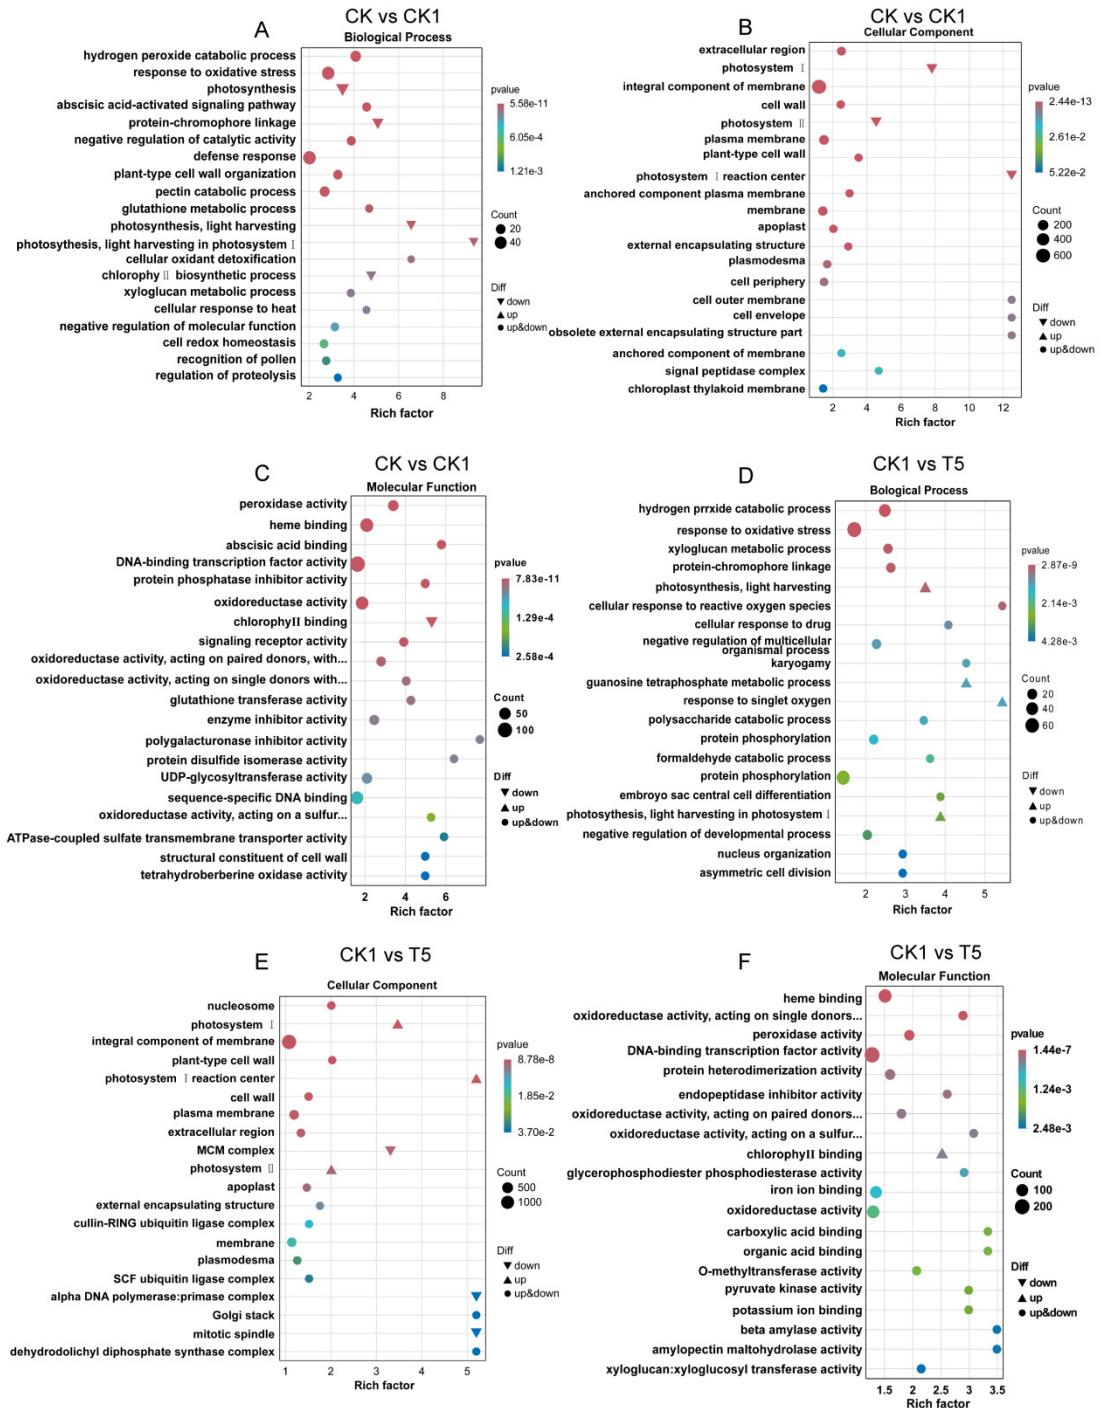

Figure S5 GO enrichment analysis of DEGs

(A), (B) and (C) are the GO enrichment results of biological processes, cell components and molecular functions of DEGs in CK VS CK1 group, respectively. (D), (E) and (F) are the GO enrichment results of biological processes, cell components and molecular functions of DEGs in CK1 VS T5 groups, respectively.

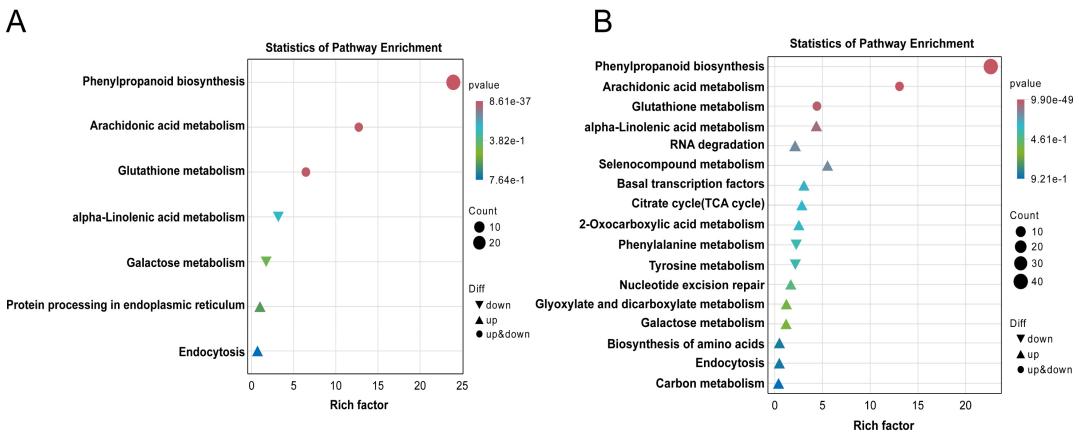

Figure S6 KEGG bubble map of transcriptome DEGs

The GO biological processes significantly enriched for "oxidative stress" (GO:0006979) and "hydrogen peroxide catabolism" (GO:004274) were then analysed for KEGG enrichment. (A) CK vs CK1; (B) CK1 vs T5.

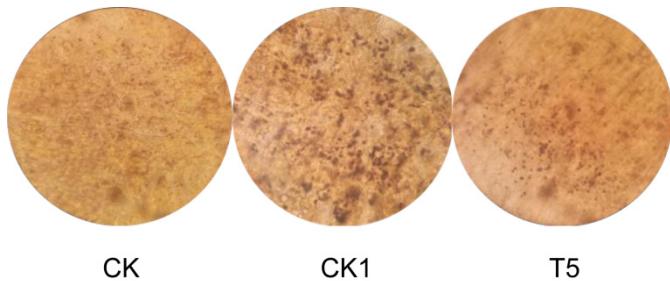

Figure S7 Starch-stained freehand sections of pea primary roots from different treatments

Pea primary roots cultured for 72 h were stained in Lugol's iodine solution for 10 min, sectioned freehand and then observed under a light microscope (16×40) for changes in starch distribution.

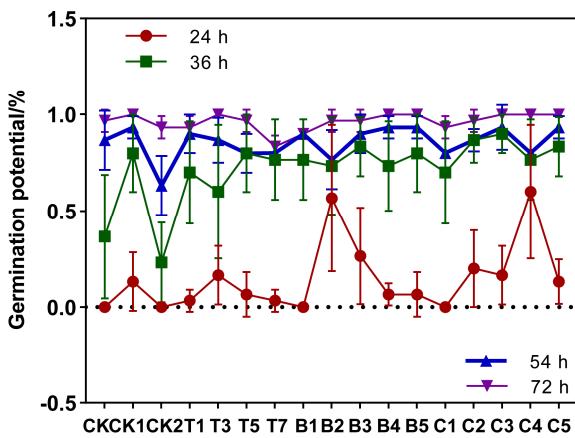

Figure S8 Pea primary root germination potential under different treatments at different times
