

A) Low PD-L1 index patient

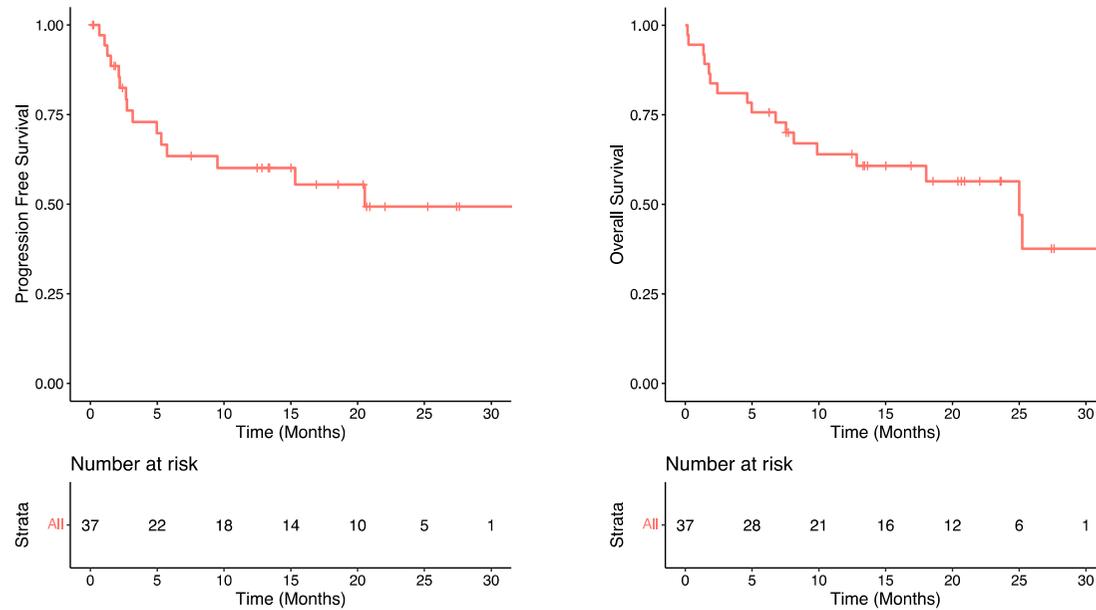

B) High PD-L1 index patient

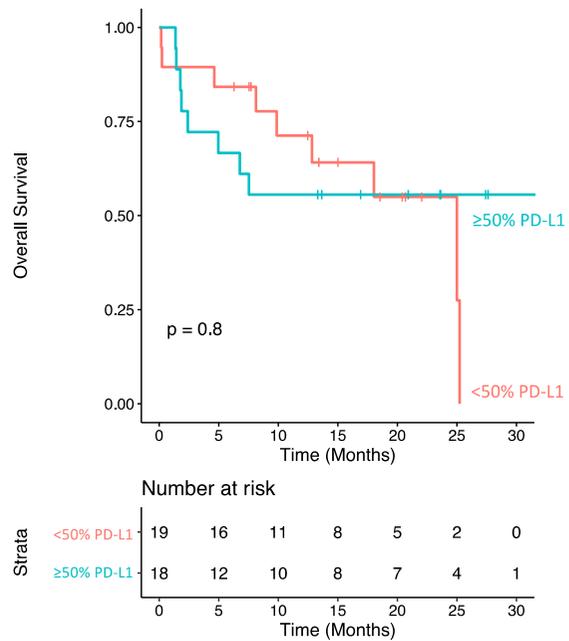

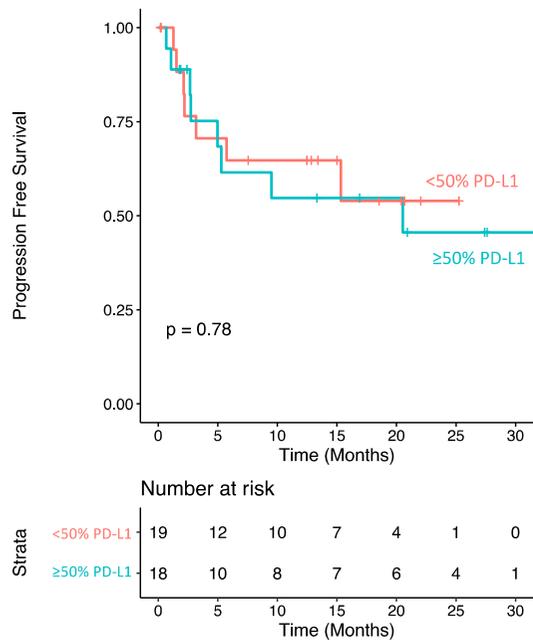

C)

**Figure S1. Comparison of two patients with different PD-L1 index.** Representative analysis of a low PD-L1 index patient with a value of 4.54 (A) and a high PD-L1 index patient with a value of 6.65 (B). The mean fluorescence intensity (MFI) and standard deviation are used to calculate the PD-L1 index, where patients with a high PD-L1 index show a higher reactivity against the PE-PD-L1 antibody.

**Figure S2. Kaplan-Meier plot of progression-free survival and overall survival from stage III-IV NSCLC patients.**

**Figure S3. PD-L1 expression of tumor tissue, assessed by immunohistochemistry, did not predict PFS nor OS at baseline.**

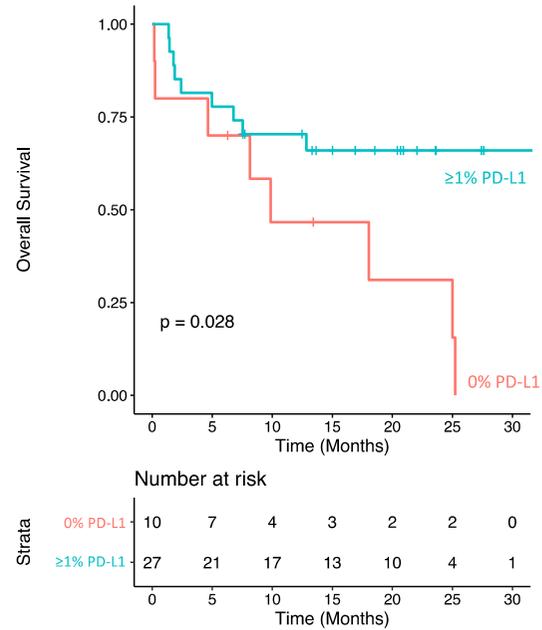

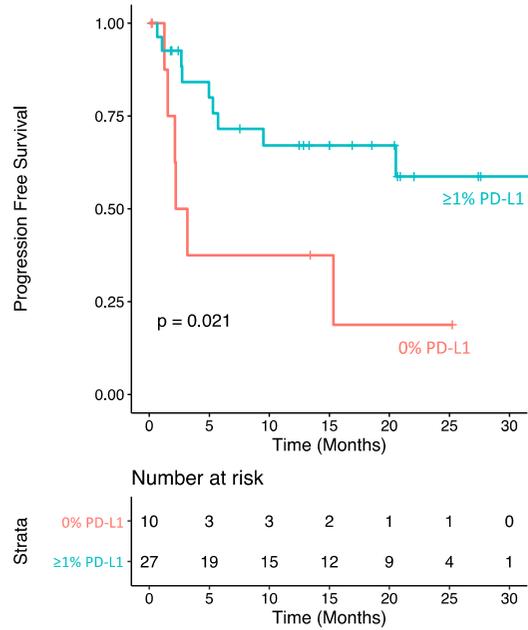

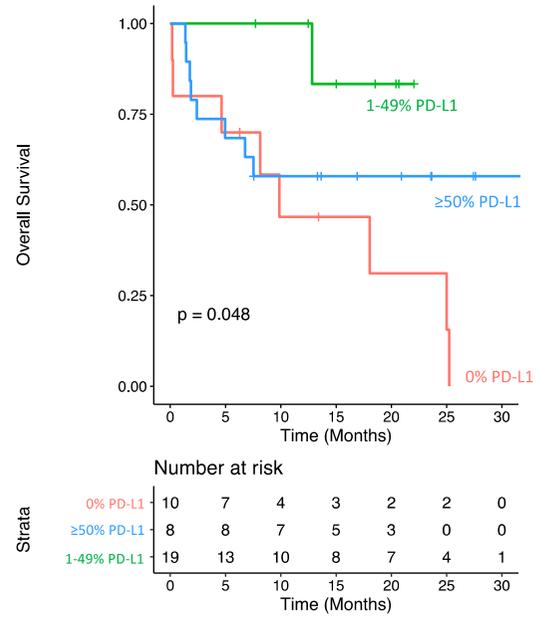

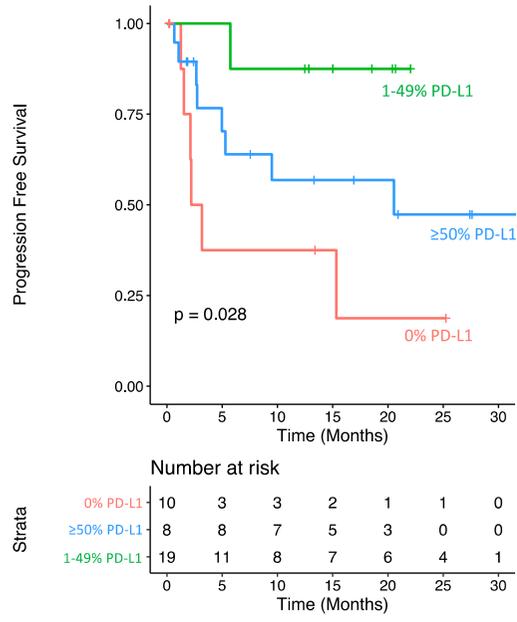

Figure S4. PD-L1 expression of tumor tissue stratified by expression and no expression predicted PFS and OS at baseline.

**Figure S5. PD-L1 expression of tumor tissue stratified in three levels of expression.**

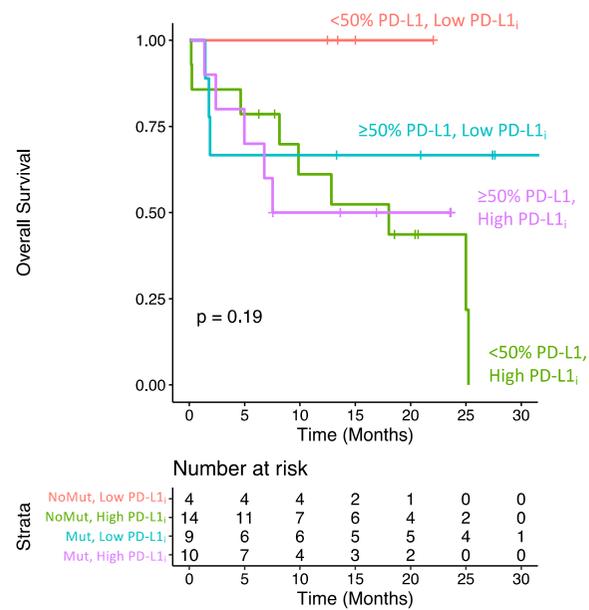

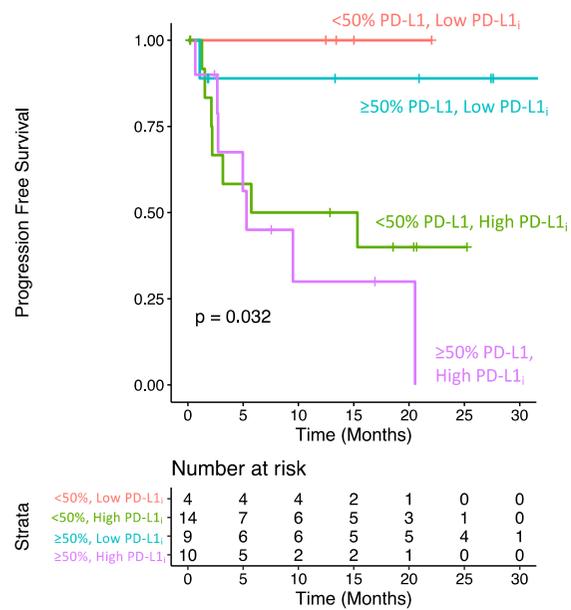

Figure S6. The combination of tumor PD-L1 expression and PD-L1 index did not improve the PFS nor OS prediction at baseline.

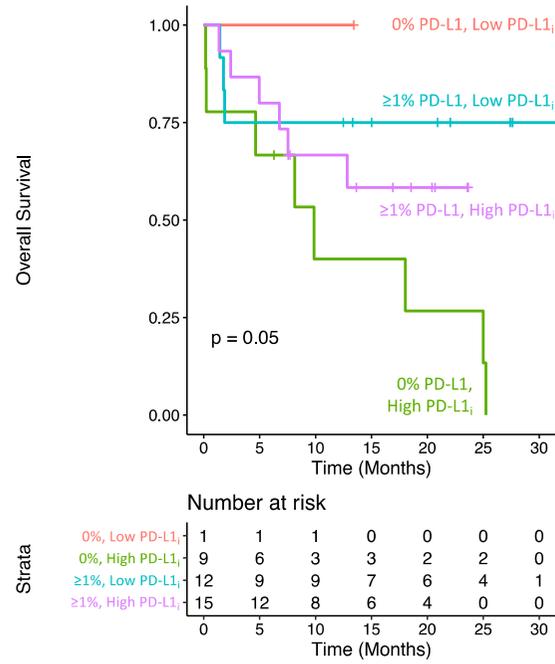

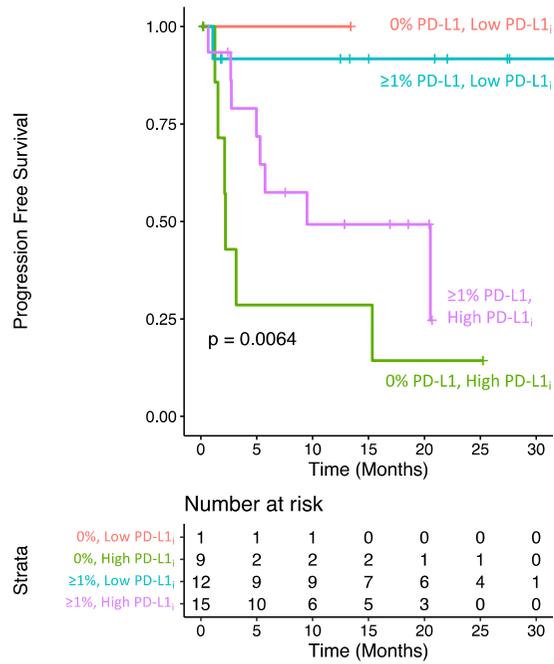

Figure S7. The combination of tumor PD-L1 expression and PD-L1 index did not improve the PFS nor OS prediction at baseline.

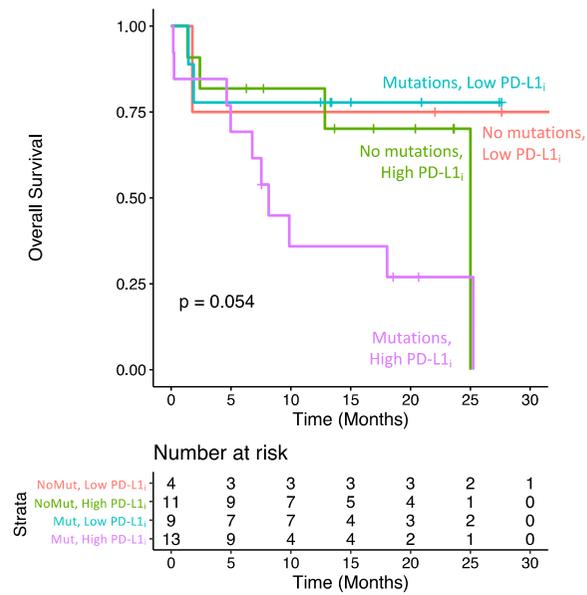

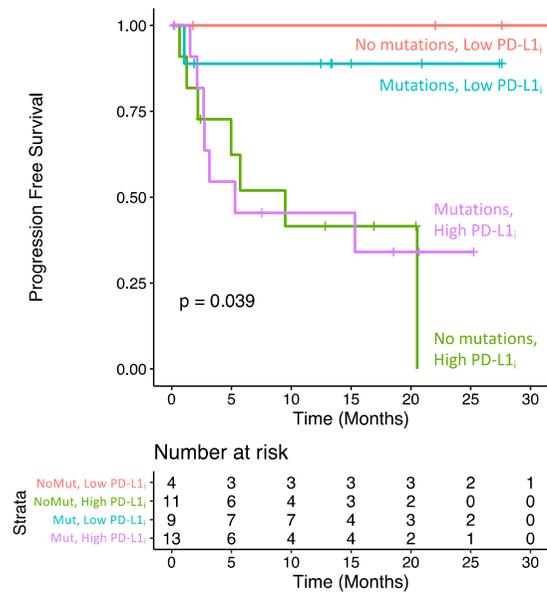

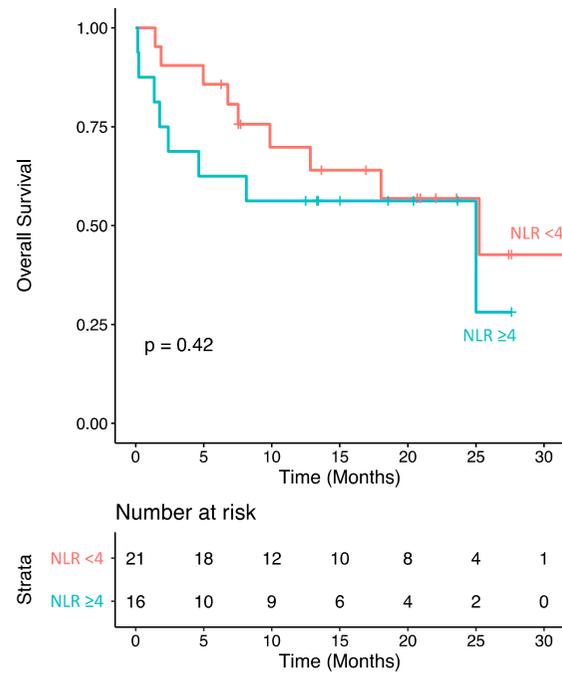

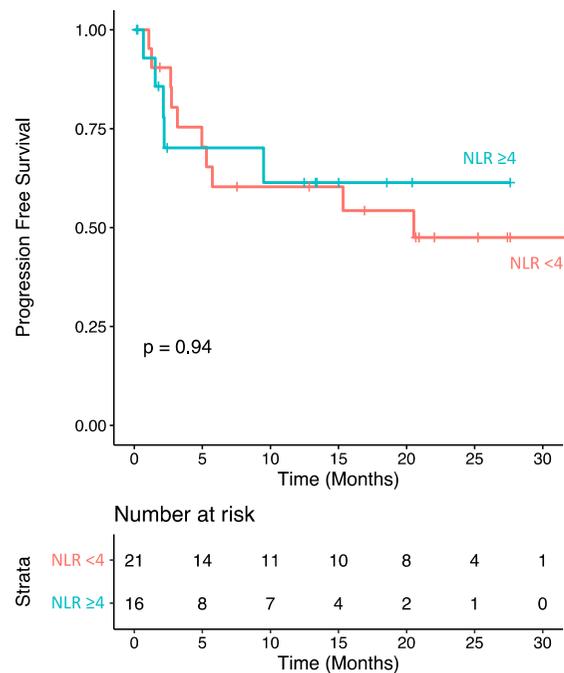

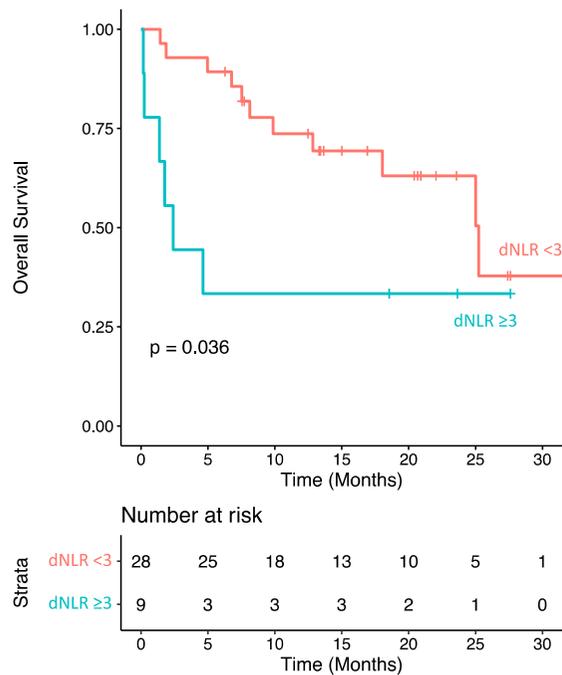

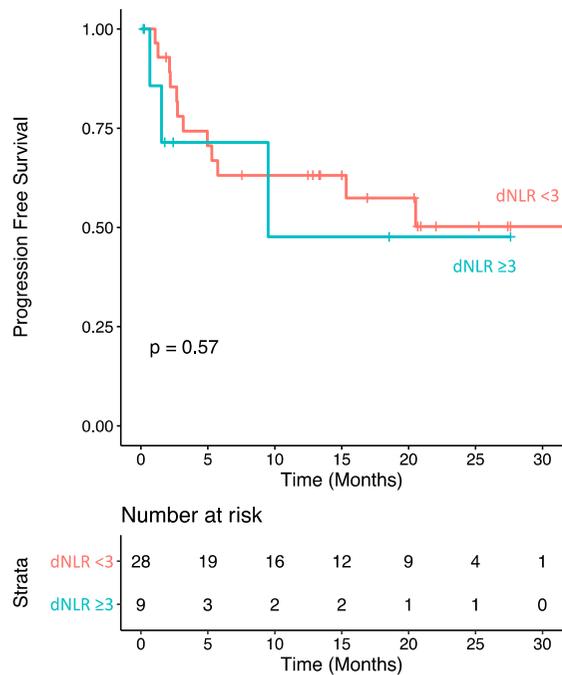

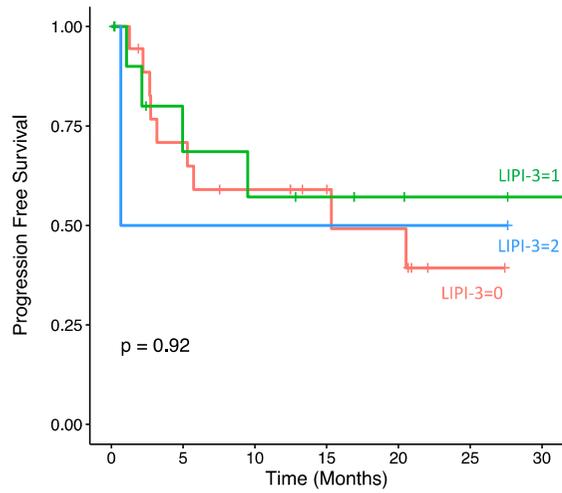

Figure S8. The presence of driver mutations combined with PD-L1 index did not improve the PFS nor OS prediction at baseline.

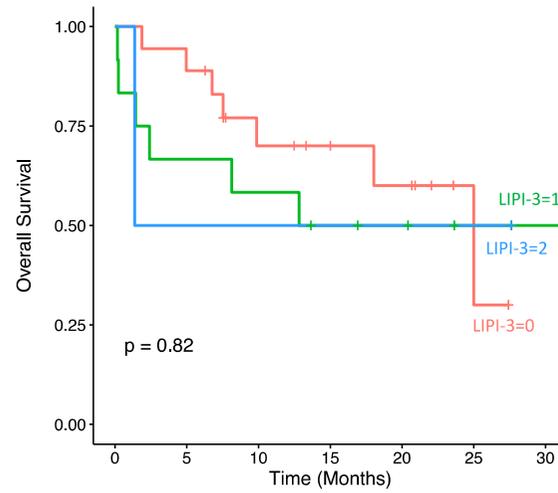

**Figure S9. Neutrophil-to-lymphocyte ratio (NLR) did not predict PFS nor OS at baseline.**

**Figure S10. Derived neutrophil-to-lymphocyte ratio (dNLR) did not predict PFS nor OS at baseline.**

|        |        | Number at risk |    |    |    |    |    |    |
|--------|--------|----------------|----|----|----|----|----|----|
| Strata | LIPI=0 | 18             | 12 | 9  | 7  | 5  | 1  | 0  |
|        | LIPI=1 | 12             | 6  | 5  | 4  | 3  | 2  | 1  |
|        | LIPI=2 | 2              | 1  | 1  | 1  | 1  | 1  | 0  |
|        |        | 0              | 5  | 10 | 15 | 20 | 25 | 30 |

|        |        | Number at risk |    |    |    |    |    |    |
|--------|--------|----------------|----|----|----|----|----|----|
| Strata | LIPI=0 | 18             | 16 | 10 | 8  | 6  | 2  | 0  |
|        | LIPI=1 | 12             | 8  | 7  | 5  | 4  | 2  | 1  |
|        | LIPI=2 | 2              | 1  | 1  | 1  | 1  | 1  | 0  |
|        |        | 0              | 5  | 10 | 15 | 20 | 25 | 30 |

**Figure S11. Lung immune prognostic index (LIPI) did not predict PFS nor OS at baseline.**

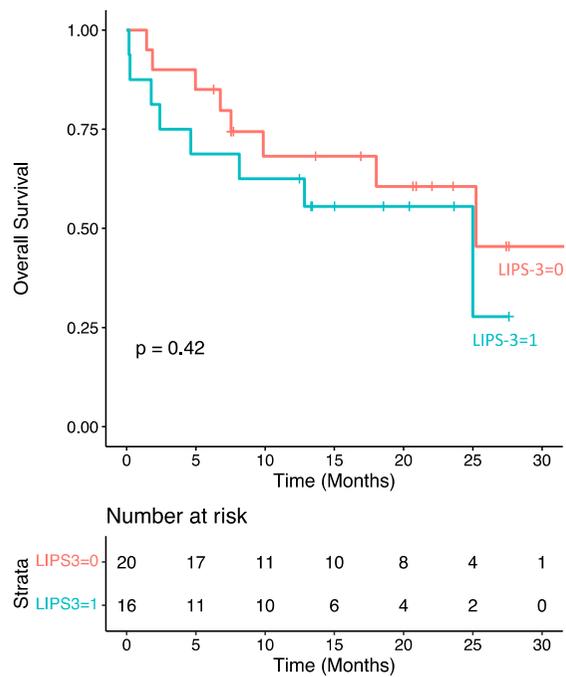

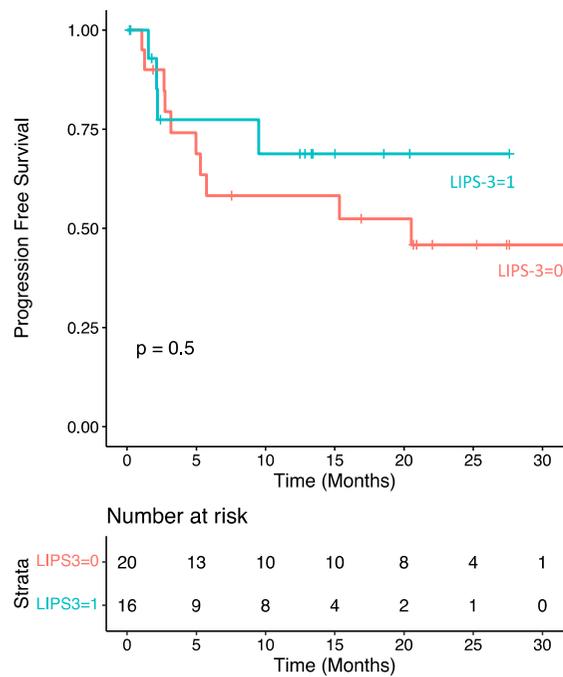

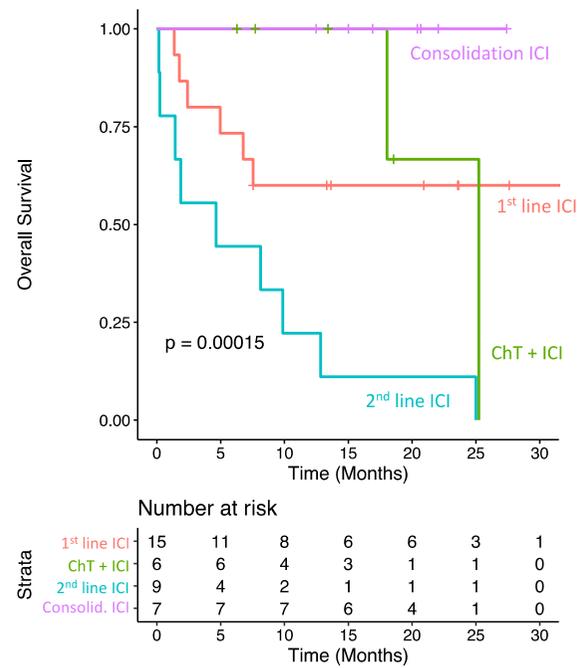

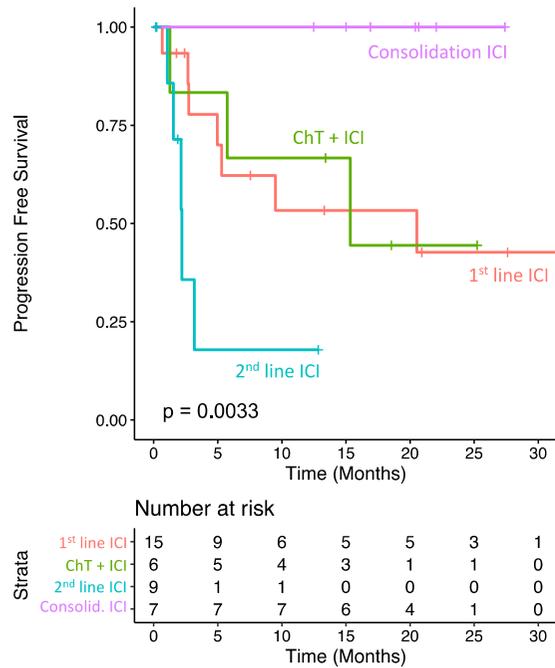

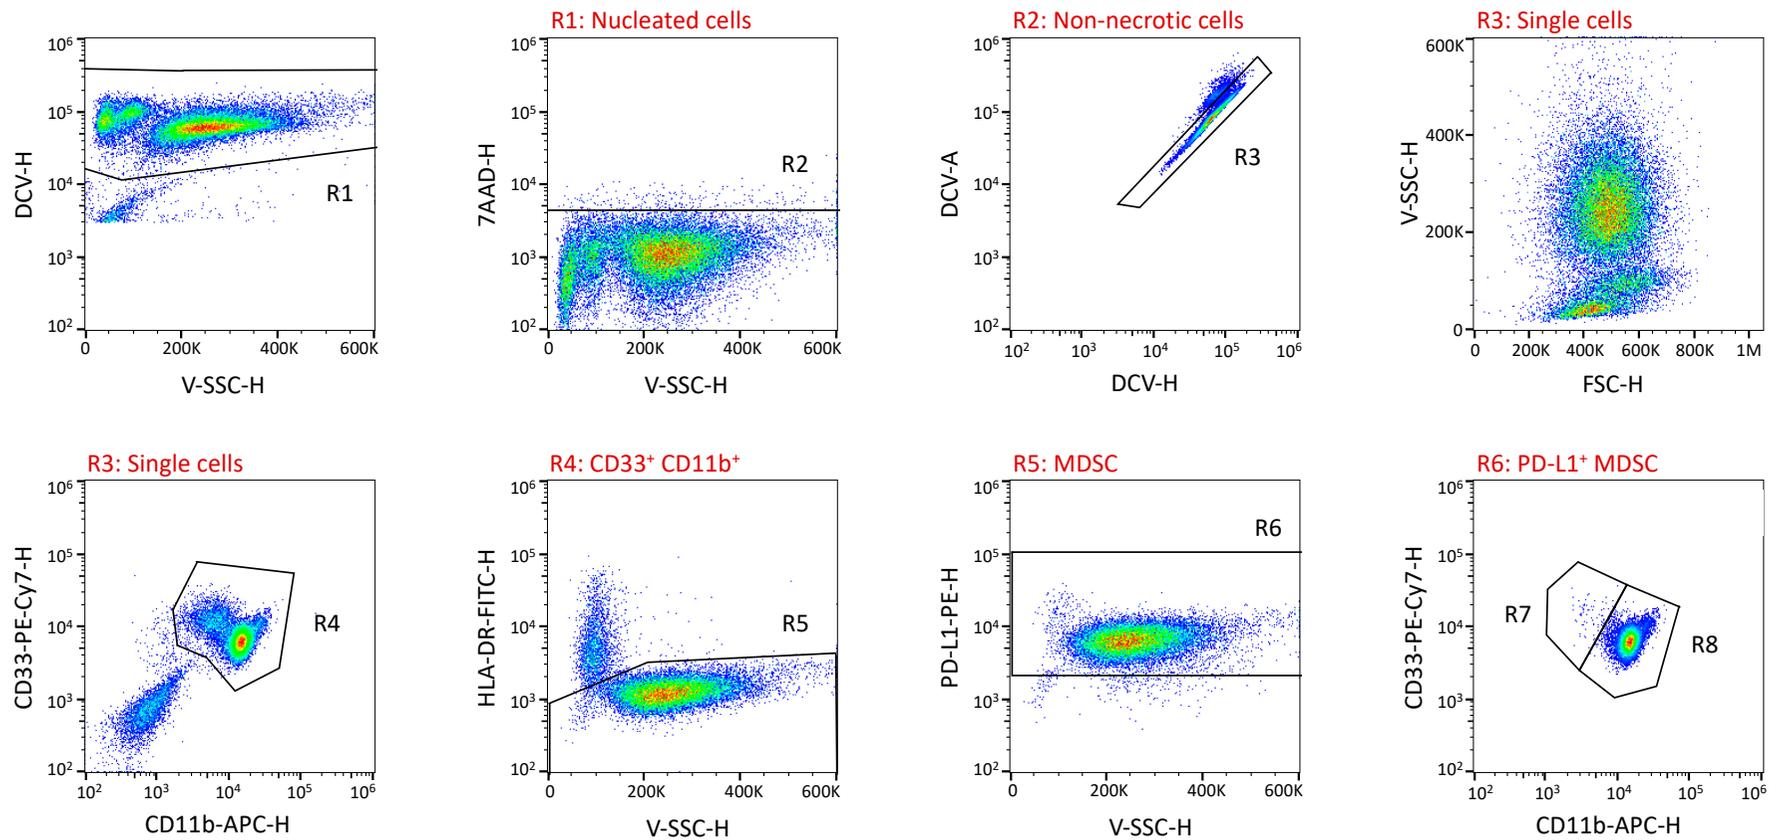

Figure S12. Lung immuno-oncology prognostic score-3 (LIPS-3) did not predict PFS nor OS at baseline.

**Figure S13. Treatment-strategy influence on PFS and OS.** In first-line ICI and first-line chemotherapy plus ICI (ChT + ICI), pembrolizumab is administered. In second-line ICI the therapy indication is pembrolizumab, nivolumab and atezolizumab, and in consolidation ICI after chemoradiation, durvalumab is administered.

**Figure S14. Flow cytometry panel and gating strategy for identification and classification of PD-L1<sup>+</sup> MDSCs.** Representative analysis of a peripheral blood sample from an NSCLC patient. Nucleated cells are selected based on DCV<sup>+</sup> events (R1) and both necrotic cells (R2) and doublets (R3) are excluded from the analysis. CD33<sup>+</sup>CD11b<sup>+</sup>HLA-DR<sup>-/lo</sup> events are then selected as MDSCs (R4-5). PMA-stimulated cells are highly reactive to the anti-PD-L1 monoclonal antibody and are selected as PD-L1<sup>+</sup> MDSCs (R6). MDSCs can be further classified into monocytic (R7) and polymorphonuclear MDSCs (R8).

**Table S1. Univariate PFS analysis**
