## Sex-Based Differences in Multilocus Heterozygosity in Wild Boar from Spain

Javier Pérez-González, Sebastián J. Hidalgo de Trucios, Sebastián P. Hidalgo Toledo

**Figure S1.** Structure results. Membership coefficient of probability for wild boar individuals. Each individual is represented by a thin line, which is portioned into colored segments representing the individuals' estimated membership fraction in K clusters. The figure shows the results for K = 2, K = 3, and K = 4. Individuals from different sampling points are separated by vertical black lines. See distribution of the sampling points in Figure 1.
