Fig. S1 Mouse tail tendon and barium titanate nano-crystals images using free-space laser propagation. The images of mouse tail tendon (a, b) and barium titanate crystal (c, d) captured using a free-space laser propagation at 810 nm and 900 nm excitation wavelength (20x objective, zoom 3, 341 pixels x 341 pixels, 10.7 μ s dwell time, \sim 20 mW power). Scale bar = 50 μ m.

Fig. S2 SHG images of Barium titanate nano-crystals with all fibers in non-descanned and descanned configurations. The images of barium titanate crystal taken using NDD A (1-6) and DD B (1-6) configuration 1 meter long SCF, SC-ARF and DC-ARF at 810 nm and 900 nm excitation wavelength (NDD: 20x objective, zoom 3, 341 pixels x 341 pixels, 10.7 μ s dwell time, ~20 mW power; DD: 20x objective, zoom 3, 341 pixels, 27 μ s dwell time, ~ 20 mW power, average 10 frames). Scale bar = 50 μ m.

Fig. S3 SHG images of mouse tail tendon with all fibers of 1 m length in non-descanned and descanned configurations. The images of mouse tail tendon taken using NDD **A (1-6)** and DD **B (1-6)** configuration (with their schematic representation) for 1 meter long SCF, SC-ARF and DC-ARF at 810 nm and 900 nm excitation wavelength (NDD: 20x objective, zoom 3, 341 pixels x 341 pixels, 10.7 μs dwell time, ~ 20 mW power; DD: 20x objective, zoom 3, 341 pixels x 341 pixels, 27 μs dwell time, ~ 20 mW power, average 10 frames). Scale bar = 50 μm .

Fig. S4 Line profile examples. Example of mouse tail (a) and barium titanate crystal (b) images with the line profiles used in Fig. 5 and S4 respectively. Line profiles were taken across areas that had both the sample as well as some blank areas.

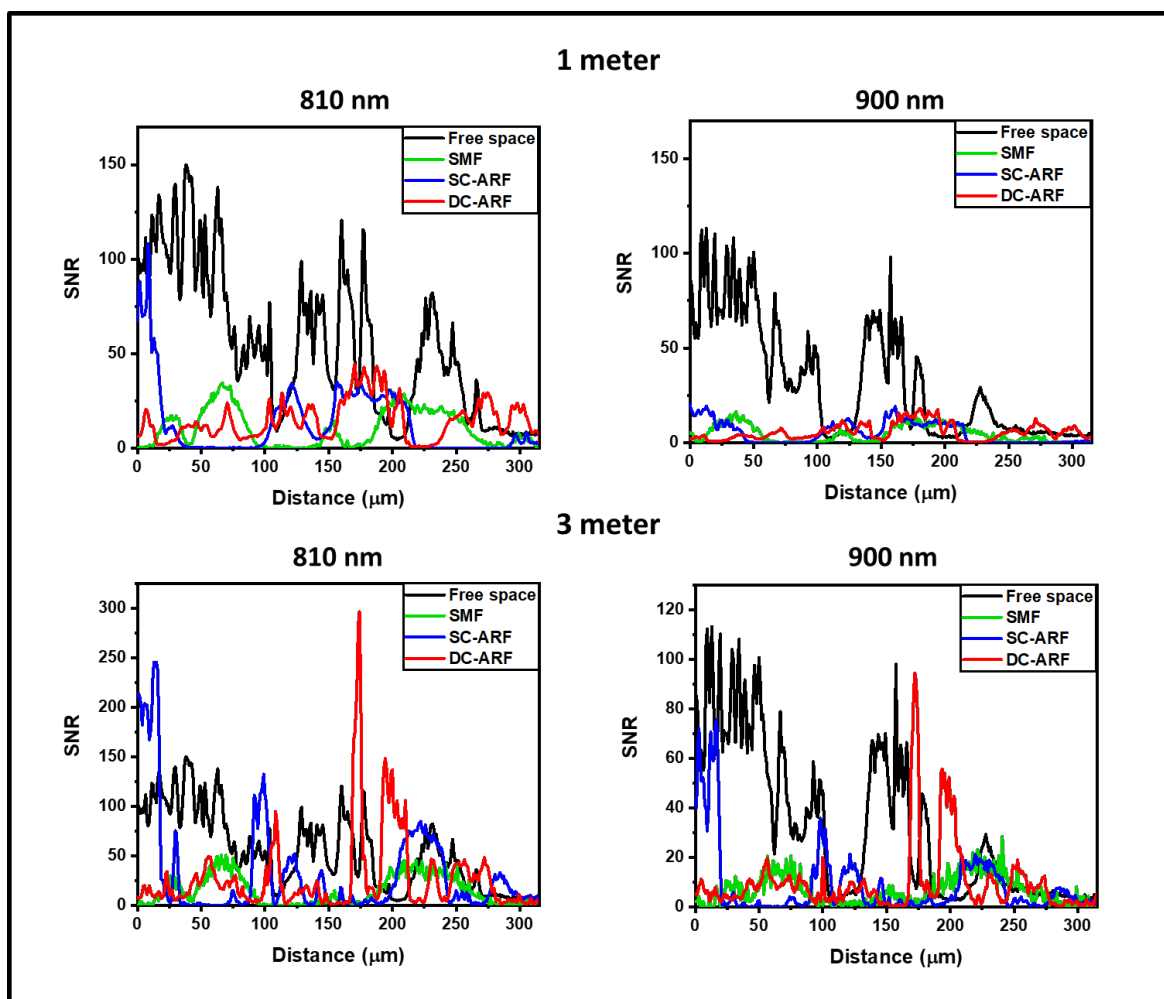

Fig. S5 Average SNR vs distance plots. These profiles were obtained for 1 and 3 m SCF, SC-ARF, and DC-ARF in NDD compared with the imaging configuration with a free-space laser coupled. These SNR profiles are calculated for images of a barium titanate nanocrystal sample.

Fig. S6 Signal profiles for SCF. Signal intensities over a line profile of the same image for a 1 and a 3 m SCF. The signals decrease approximately 7 times due to anomalous GVD and non-linearity. The images were collected in the NDD configuration.

Fig. S7 Signal profiles for SC-ARF and DC-ARF. Signal intensities over a line profile of approximately the same imaging area (due to alignment issues the image was not exactly the same) for a 1 and a 3 m SC-ARF and DC-ARF. The signals are of approximately similar levels between the two lengths in either of the fibers. The images were collected in the NDD configuration.
