

Supplemental Figure S1: Change from baseline in intraocular pressure (upper panel) and tear production (lower panel) after either intravenous or ocular administration of 100  $\mu\text{g}/\text{kg}$  naloxone to 6 male dogs.

EDTA, ethylenediaminetetraacetic acid; IOP, intraocular pressure; i.v., intravenous; PG, propylene glycol; STT, Schirmer's tear test.

\* $P = 0.02$  compared to i.v. administration.
