^a ¹³C values were deduced from HSQC and HMBC spectra.^b Multiplicity derived from the HSQC spectrum.

Figure S1. LRMS/MS spectra from the fragmentation of 7(*E*)-9-keto-hexadec-7-enoic acid (**1**) in the negative mode. The product ion scan parameters used were as follows: negative mode; scan rate (Da/sec):1000; used collision energy ramp (CER); Q1 and Q3 resolution (FWHM): 0.7; CID gas (mTorr): 1.5; chromatographic peak width: 6.

Figure S2. HRMS spectra of 7(*E*)-9-keto-hexadec-7-enoic acid (**1**) and (**2**) 7(*E*)-9-hydroxy-hexadec-7-enoic acid in the negative mode.

Figure S3. HRMS spectra of 9(*Z*)-hexadec-9-enoic acid (**3**) and hexadecanoic acid (**4**) in the negative mode

Figure S4. LRMS spectra of the ozonolysis products of compounds **2** and **3** in the negative mode.

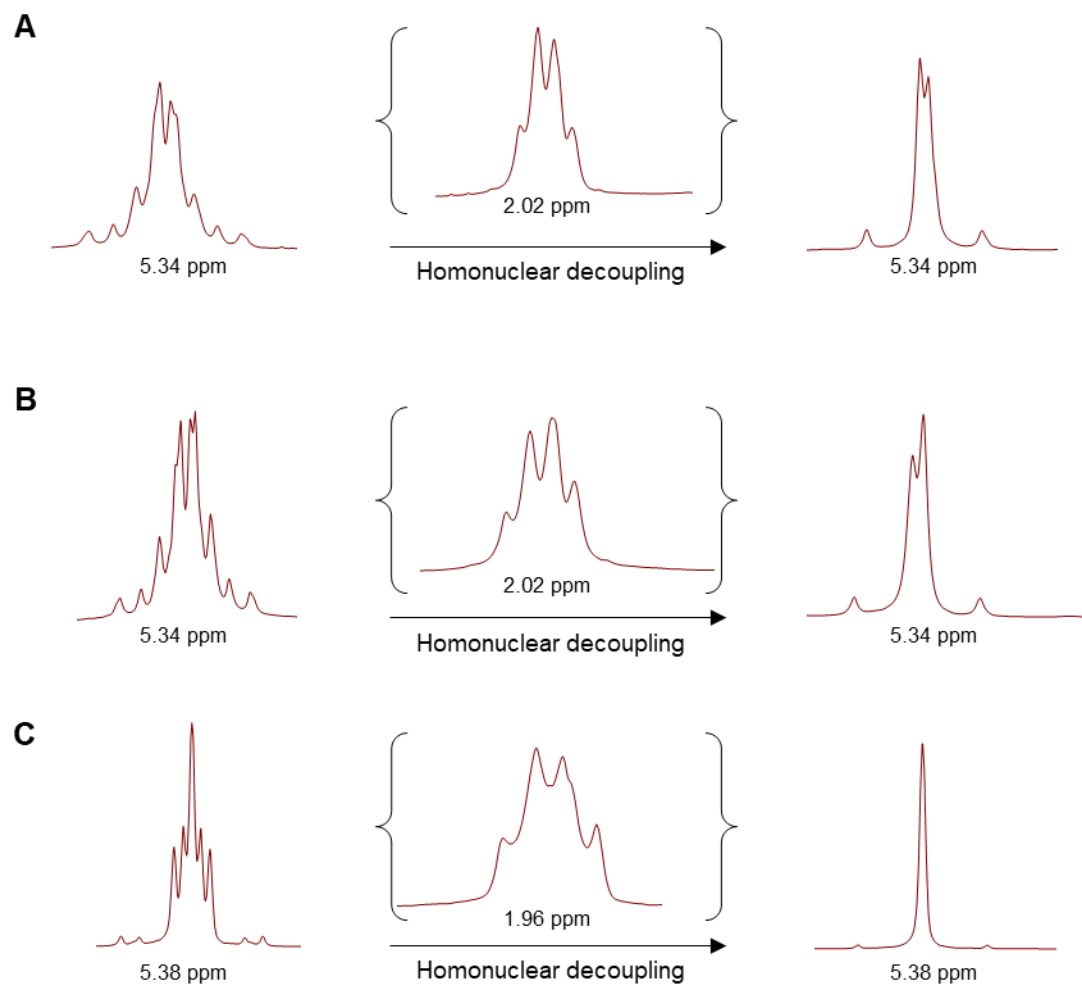

Figure S5. Homonuclear decoupling of allylic protons and the change in the ^1H NMR signals (600 MHz; CDCl_3) of olefinic protons before and after decoupling. A) 9(*Z*)-hexadec-9-enoic acid (**3**). B) Commercially available standard 9(*Z*)-hexadec-9-enoic acid. C) Commercially available standard 9(*E*)-hexadec-9-enoic acid. The allylic protons are shown between brackets.

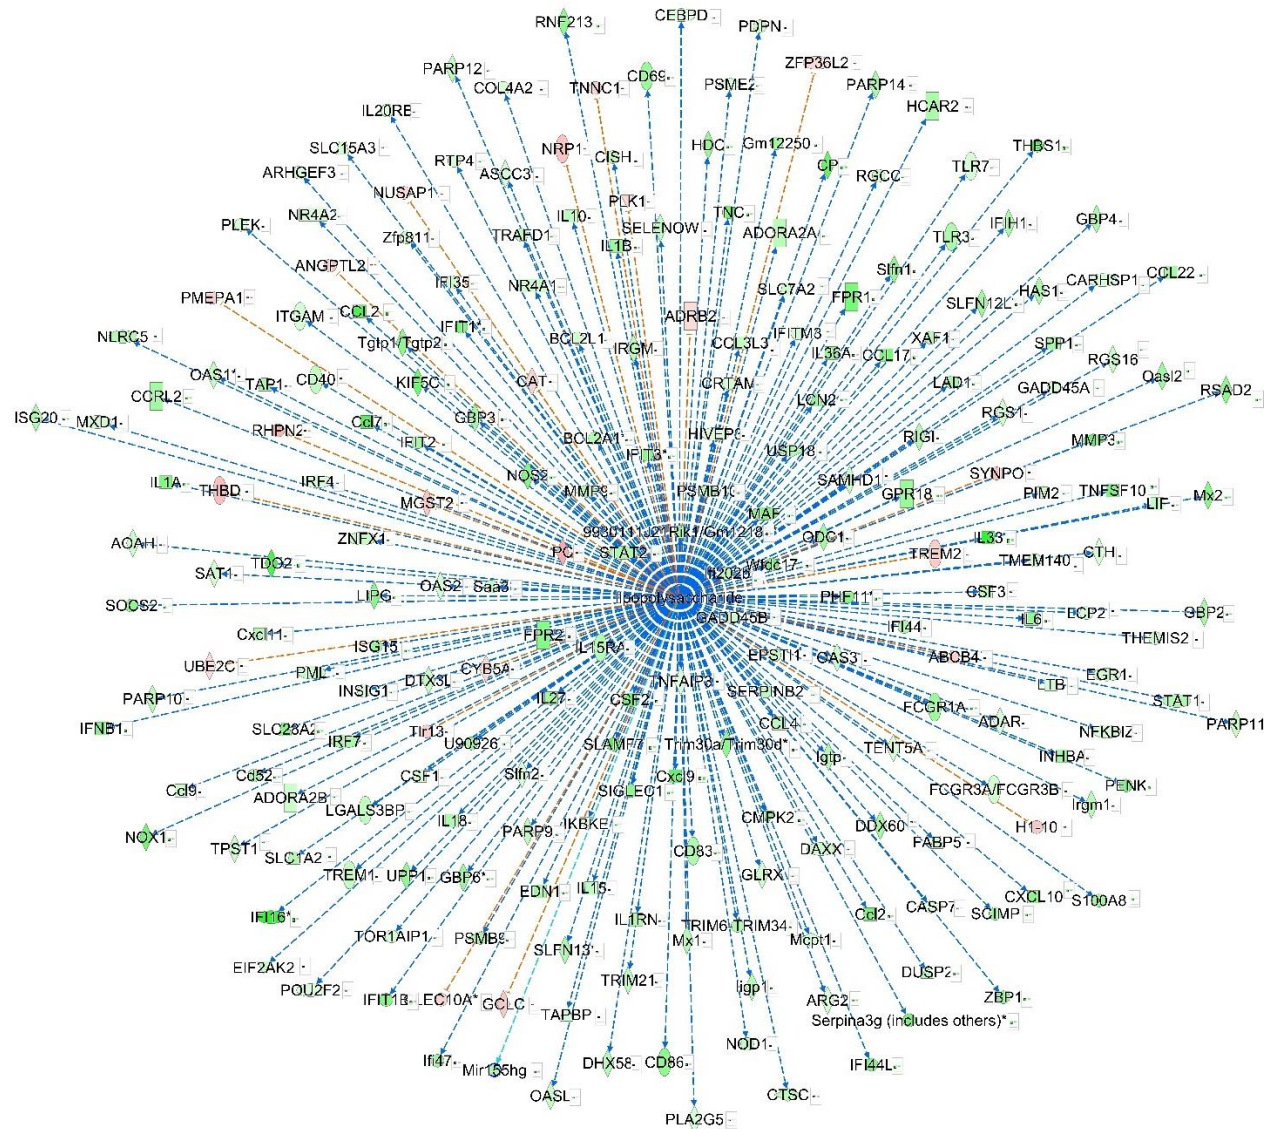

Figure S6. Upstream regulator network of LPS showing all genes with measurement direction consistent with its predicted inhibition state. Blue lines indicate inhibition while orange lines indicate activation.

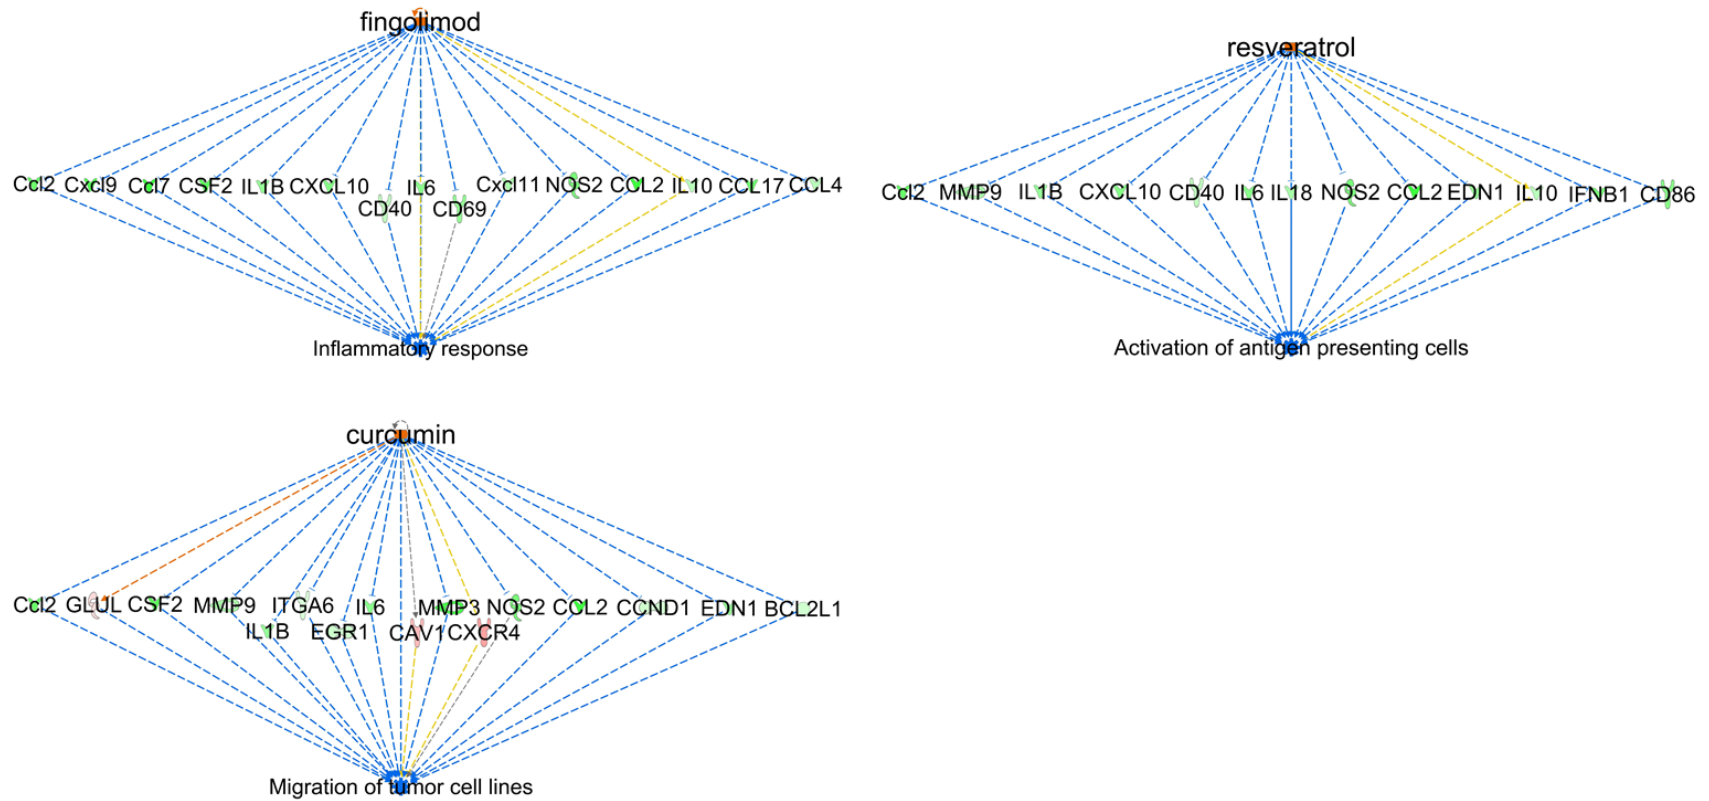

Figure S7. Regulator effect networks of the Nrf2 activators fingolimod, resveratrol, and curcumin predicted to be activated as it downregulates the same set of genes that are downregulated in the dataset in response to **1**. Blue lines indicate inhibition while orange lines indicate activation. Green nodes indicate downregulation while red nodes indicate upregulation.
