4. Optimization of culture conditions

The optimal culture condition was determined by the orthogonal experiment, in which three media, two culture methods and nine culture periods were used.

The fungal strain 19-7-ZM-4 was initially cultured on the panels of PDA medium at 28 °C for 3 days. The fresh mycelia were inoculated into 500 mL Erlenmeyer flasks which containing 150 mL of the seed medium (medium 1) and then were grown on a rotary shaker (180 rpm) at 28 °C for 24 hours. Subsequently, 1.0 mL seed culture was inoculated into the 500 mL Erlenmeyer flask containing 150 mL of different liquid culture media. The flasks were subjected to the rotary shakers for 180 rpm shake culture or static culture at 28 °C. The fermented whole broth was filtered under reduced pressure to separate the supernatant from mycelia. The supernatant was extracted three times with EtOAc and all the extracts were evaporated under reduced pressure to yield residue. Each residue was weighed and subjected to HPLC and TLC analysis. Integration of all factors, the fungus was grown on a rotary shaker (180 rpm) in medium 3 at 28 °C for 13 days.

Medium 3	dextrose (20 g/L), maltose (20 g/L), yeast extract powder (5 g/L), peptone (10 g/L), corn steep liquor (10 g/L), KH ₂ PO ₄ (0.5 g/L), MgSO ₄ (0.5 g/L) and seawater.

5. Cytotoxicity Assay.

The cytotoxic activity against the K562 (human leukemia) cell line was evaluated by MTT method, and the cytotoxic activities against L-02 (normal human hepato-cytes), ASPC-1 (human pancreatic cancer), MDA-MB-231 (human breast cancer), NCI-H446 and NCI-H446/EP (human small cell lung cancer) cell lines were determined by SRB method. Doxorubicin was used as a positive control.

In the cytotoxic assay, preliminary screening for cytotoxicity of compounds was performed at the concentration of 30 μ M, then the compounds with inhibition rate greater than 60 % were rescreened for the IC₅₀ values. The blank control, vehicle control, positive control (doxorubicin) and compounds at five different concentrations (30, 15, 7.5, 3.75, 1.875 and 0.9375 μ M) were tested three times and the average OD values were taken to calculated IC₅₀ values.
