Fig. S1. Rarefaction analyses of samples (a) and Shannon Wiener curves of samples.(rarefaction curves of OTUs clustered at 97% sequence identity across different soil samples. Soil 0 and soil1 respectively represent the Wei he Terrace silty and loam soil silty loam in Loess Tableland. B, G and W: the reclamation plants of Agropyron cristatum (L.) Gaertn, Cynodondactylon Linn.Pers, and undisturbed plants, respectively; original TPH 0, 3, 7, and 10: 0 mg/kg (control), 3,000 mg/kg, 7,000 mg/kg, and 10,000 mg/kg, respectively.)

Fig. S2. Community structure in all samples at the orders level. (relative abundances (>0.2%) are based on the proportional frequencies of those DNA sequences that could be classified at the orders level.)

Fig. S3. Multiple-samples PCA analysis of 24 samples associated with bacterial community and physicochemical soil.

Fig. S4. Correlation network diagram at the genera level. (circles represent specifical species, and the size of circles stand for the abundance. the correlation between two species describe as line weight and color. The wide lines explained the strength of correlation. The color of lines is orange, which is positive correlation, and green stand for negative correlation. Screening data with a

correlation greater group (>0.1) draw a common expression analysis network diagram at the python level).
