

**Table S1 Modified PROGRESS-Plus Framework**

Socioeconomic/sociodemographic characteristics considered in the systematic review using PROGRESS-Plus as conceptual framework (see reference below). These social factors may contribute to unequal health status within and between populations.

The PROGRESS-Plus Framework has been modified according to the research question of this review.

PROGRESS	
Ethnicity	Ethnic background
Occupation	Professional, skilled, unskilled, unemployed, etc
Gender	Male or female
Religion	Religious background
Education	Years in and/or level of education attained
Social capital	Neighbourhood/community/family support
Economic position	Income, means tested benefits/welfare, affluence measures, etc
PLUS	
Indices	Index of deprivation at a regional level using aggregated data (e.g. income-related, education, occupation, elements of place residence) or index at individual level using (e.g. education, income, occupational status of individuals)
Age	Age range or certain age groups
Disability	Existence of physical or emotional/mental disability
Sexual orientation	Heterosexual, gay, lesbian, bisexual, transgender
Other vulnerable groups	School non-attenders, young person in criminal justice system, victims of abuse, teenage parents

The term 'economic position' is used in this table to encompass the key elements of what in UK research has traditionally been termed 'social class'.

<p>Our hypothesis is that there is a relationship between poor air quality and low socio-economic position. In the studies examined low socio-economic position has been identified using a range of variables e.g. deprivation, income, poverty rate, income support. To standardize the data extraction and to make it easier to understand we have used a ⊕ where the relationship is in the direction of our hypothesis.</p> <p>For other indicators of a social dimension that were not directly related to income e.g. education, age, foreign nationals, ethnic characteristics then where those values of these variables indicating social disadvantage are associated with poor air quality we have also used a ⊕.</p> <p>„=“ = no socioeconomic unequal distribution of <i>air pollution</i>  n.s. = not significant  „⊕“ = lower social dimension groups (e.g. more deprived populations) have higher <i>air pollution levels</i> or lower distances to road/ higher traffic count / significant association in correlation or multivariate analysis (p-value &lt; 0.05)  „⊖“ = lower social dimension groups (e.g. more deprived populations) have lower <i>air pollution levels</i> or greater distances to road/ lower traffic count/ significant association in correlation or multivariate analysis (p-value &lt; 0.05)</p>									

**Table S4 Table Place of residence**

A small amount of studies have carried out a stratification by a characteristic of Place of residence.

Study	Place of residence characteristics	Weight of evidence
Bertin et al	Urban or rural	Urban Deprivation ⊖  Rural Deprivation ⊖

# PRISMA 2009 Checklist

Section/topic	#	Checklist item	Reported on page #
<b>TITLE</b>			
Title	1	Identify the report as a systematic review, meta-analysis, or both.	1
<b>ABSTRACT</b>			
Structured summary	2	Provide a structured summary including, as applicable: background; objectives; data sources; study eligibility criteria, participants, and interventions; study appraisal and synthesis methods; results; limitations; conclusions and implications of key findings; systematic review registration number.	1
<b>INTRODUCTION</b>			
Rationale	3	Describe the rationale for the review in the context of what is already known.	1,2
Objectives	4	Provide an explicit statement of questions being addressed with reference to participants, interventions, comparisons, outcomes, and study design (PICOS).	2
<b>METHODS</b>			
Protocol and registration	5	Indicate if a review protocol exists, if and where it can be accessed (e.g., Web address), and, if available, provide registration information including registration number.	2
Eligibility criteria	6	Specify study characteristics (e.g., PICOS, length of follow-up) and report characteristics (e.g., years considered, language, publication status) used as criteria for eligibility, giving rationale.	2,3,4, S1
Information sources	7	Describe all information sources (e.g., databases with dates of coverage, contact with study authors to identify additional studies) in the search and date last searched.	3,4
Search	8	Present full electronic search strategy for at least one database, including any limits used, such that it could be repeated.	3, S2
Study selection	9	State the process for selecting studies (i.e., screening, eligibility, included in systematic review, and, if applicable, included in the meta-analysis).	3,4
Data collection process	10	Describe method of data extraction from reports (e.g., piloted forms, independently, in duplicate) and any processes for obtaining and confirming data from investigators.	3,4
Data items	11	List and define all variables for which data were sought (e.g., PICOS, funding sources) and any assumptions and simplifications made.	3,4,5
Risk of bias in individual studies	12	Describe methods used for assessing risk of bias of individual studies (including specification of whether this was done at the study or outcome level), and how this information is to be used in any data synthesis.	n.a.
Summary measures	13	State the principal summary measures (e.g., risk ratio, difference in means).	6, S1
Synthesis of results	14	Describe the methods of handling data and combining results of studies, if done, including measures of consistency (e.g., I <sup>2</sup> ) for each meta-analysis.	6, S1

# PRISMA 2009 Checklist

Section/topic	#	Checklist item	Reported on page #
Risk of bias across studies	15	Specify any assessment of risk of bias that may affect the cumulative evidence (e.g., publication bias, selective reporting within studies).	n.a.
Additional analyses	16	Describe methods of additional analyses (e.g., sensitivity or subgroup analyses, meta-regression), if done, indicating which were pre-specified.	S4
<b>RESULTS</b>			
Study selection	17	Give numbers of studies screened, assessed for eligibility, and included in the review, with reasons for exclusions at each stage, ideally with a flow diagram.	4,5,6
Study characteristics	18	For each study, present characteristics for which data were extracted (e.g., study size, PICOS, follow-up period) and provide the citations.	3,4 S3
Risk of bias within studies	19	Present data on risk of bias of each study and, if available, any outcome level assessment (see item 12).	n.a.
Results of individual studies	20	For all outcomes considered (benefits or harms), present, for each study: (a) simple summary data for each intervention group (b) effect estimates and confidence intervals, ideally with a forest plot.	n.a.
Synthesis of results	21	Present results of each meta-analysis done, <del>including confidence intervals and measures of consistency.</del>	10,12,13
Risk of bias across studies	22	Present results of any assessment of risk of bias across studies (see Item 15).	n.a.
Additional analysis	23	Give results of additional analyses, if done (e.g., sensitivity or subgroup analyses, meta-regression [see Item 16]).	S4
<b>DISCUSSION</b>			
Summary of evidence	24	Summarize the main findings including the strength of evidence for each main outcome; consider their relevance to key groups (e.g., healthcare providers, users, and policy makers).	14,15
Limitations	25	Discuss limitations at study and outcome level (e.g., risk of bias), and at review-level (e.g., incomplete retrieval of identified research, reporting bias).	16,
Conclusions	26	Provide a general interpretation of the results in the context of other evidence, and implications for future research.	14,15, 16,17
<b>FUNDING</b>			
Funding	27	Describe sources of funding for the systematic review and other support (e.g., supply of data); role of funders for the systematic review.	18
