**Figure S2.** Comparison of different bias correction methods adjusting the GCM outputs.

All analyses were conducted using 27 GCM outputs and daily observed TM for 680 stations in China from 1960 to 1999. We assessed the difference between daily observed TM (red dot) and adjusted GCM outputs (box plot) corrected by different methods during winter and summer. Four indexes were employed: mean ( $\mu$ ), standard deviation ( $\sigma$ ), 10<sup>th</sup> and 90<sup>th</sup> percentiles ( $X_{10}$ ,  $X_{90}$ ).

**Figure S3.** Bayesian probabilistic population projections for Guangzhou, 2020–2100: major population indicators.

The historical observed data are shown by a black line. The Bayesian predictive distributions are shown in red: median—solid; 80% prediction interval— blue dashed; 90% prediction interval— red dashed.

**Table S2.** Population projections in Guangzhou in the 2030s, 2060s and 2090s under different scenarios.

	Population increase scenario		
	Low	Medium	High
<b>2030s</b>			
Total population (*1000)	14,229	14,773	15,518
Male population (*1000)	7,148	7,436	7,832
Female population (*1000)	7,082	7,337	7,686
Population<65 years (*1000)	11,012	11,266	11,691
Population≥65 years (*1000)	3,217	3,507	3,827
Percentage of elderly population (%)	22.61	23.74	24.66
<b>2060s</b>			
Total population (*1000)	11,974	13,710	16,103
Male population (*1000)	5,987	6,895	8,146
Female population (*1000)	5,988	6,815	7,956
Population<65 years (*1000)	8,312	8,817	9,493
Population≥65 years (*1000)	3,662	4,893	6,610
Percentage of elderly population (%)	30.58	35.69	41.05
<b>2090s</b>			
Total population (*1000)	8,601	11,761	16,655
Male population (*1000)	4,321	5,961	8,500
Female population (*1000)	4,280	5,800	8,156
Population<65 years (*1000)	6,088	7,533	9,040
Population≥65 years (*1000)	2,513	4,228	7,615
Percentage of elderly population (%)	29.22	35.95	45.72

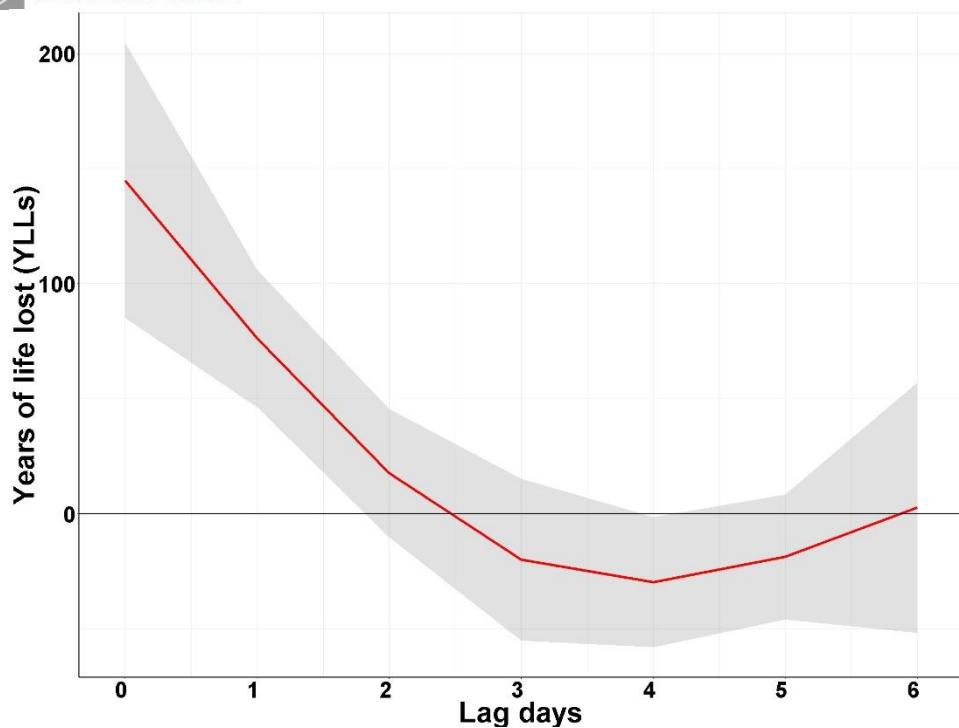

Low: The 10<sup>th</sup> percentile of future 10,000 projection trajectories. Medium: The median value of future 10,000 projection trajectories. High: The 90<sup>th</sup> percentile of future 10,000 projection trajectories. Elderly: Population≥65 years.

**Table S3.** Annual temperature (°C) in the 2030s, 2060s and 2090s under different climatic scenarios and models.

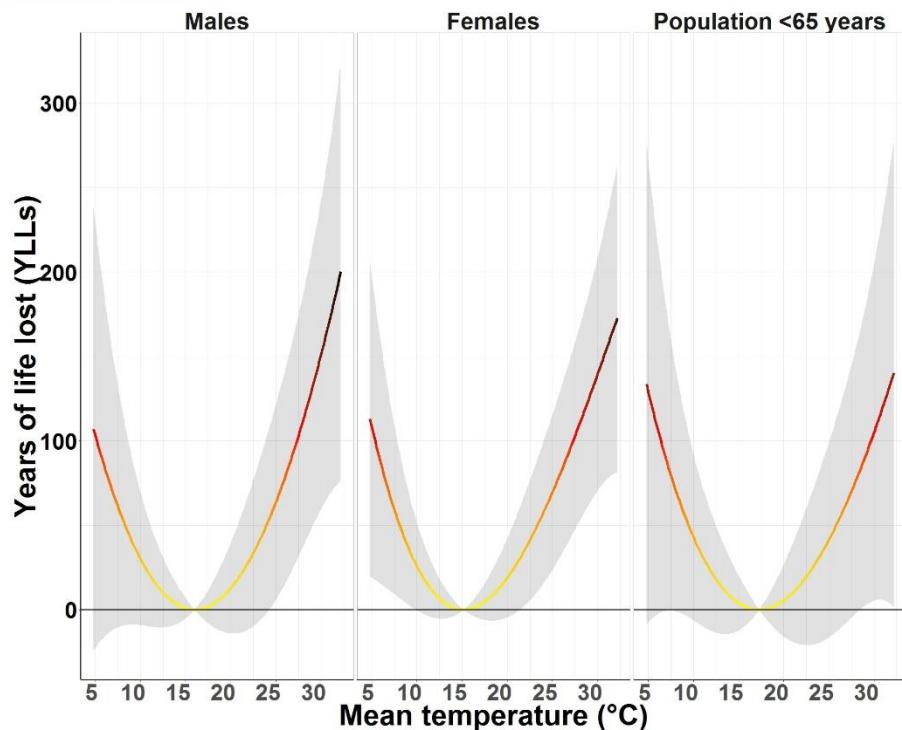

Climatic Model	Mean (SD) temperature								
	RCP 2·6			RCP 4·5			RCP8·5		
	2030s	2060s	2090s	2030s	2060s	2090s	2030s	2060s	2090s

-: Data not available.

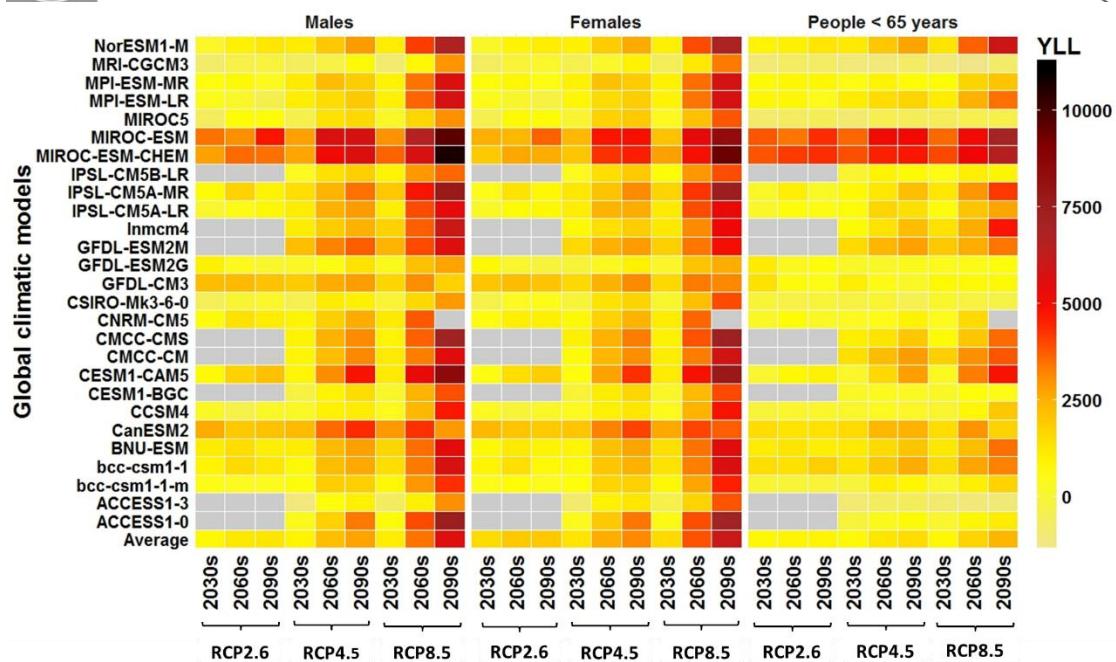

**Figure S4.** Lag effects of TM ( $30^{\circ}\text{C}$ ) on YLLs in the total population during 2010-2015 in Guangzhou, China.

Note: All effects of TM on YLLs were adjusted for secular trend, wind speed, day of week, relative humidity,  $\text{SO}_2$ ,  $\text{NO}_2$  and  $\text{PM}_{10}$ . The reference temperature was  $23.0^{\circ}\text{C}$  in the DLNM model. Lag effect: The heat effects mainly appeared during the first two days.

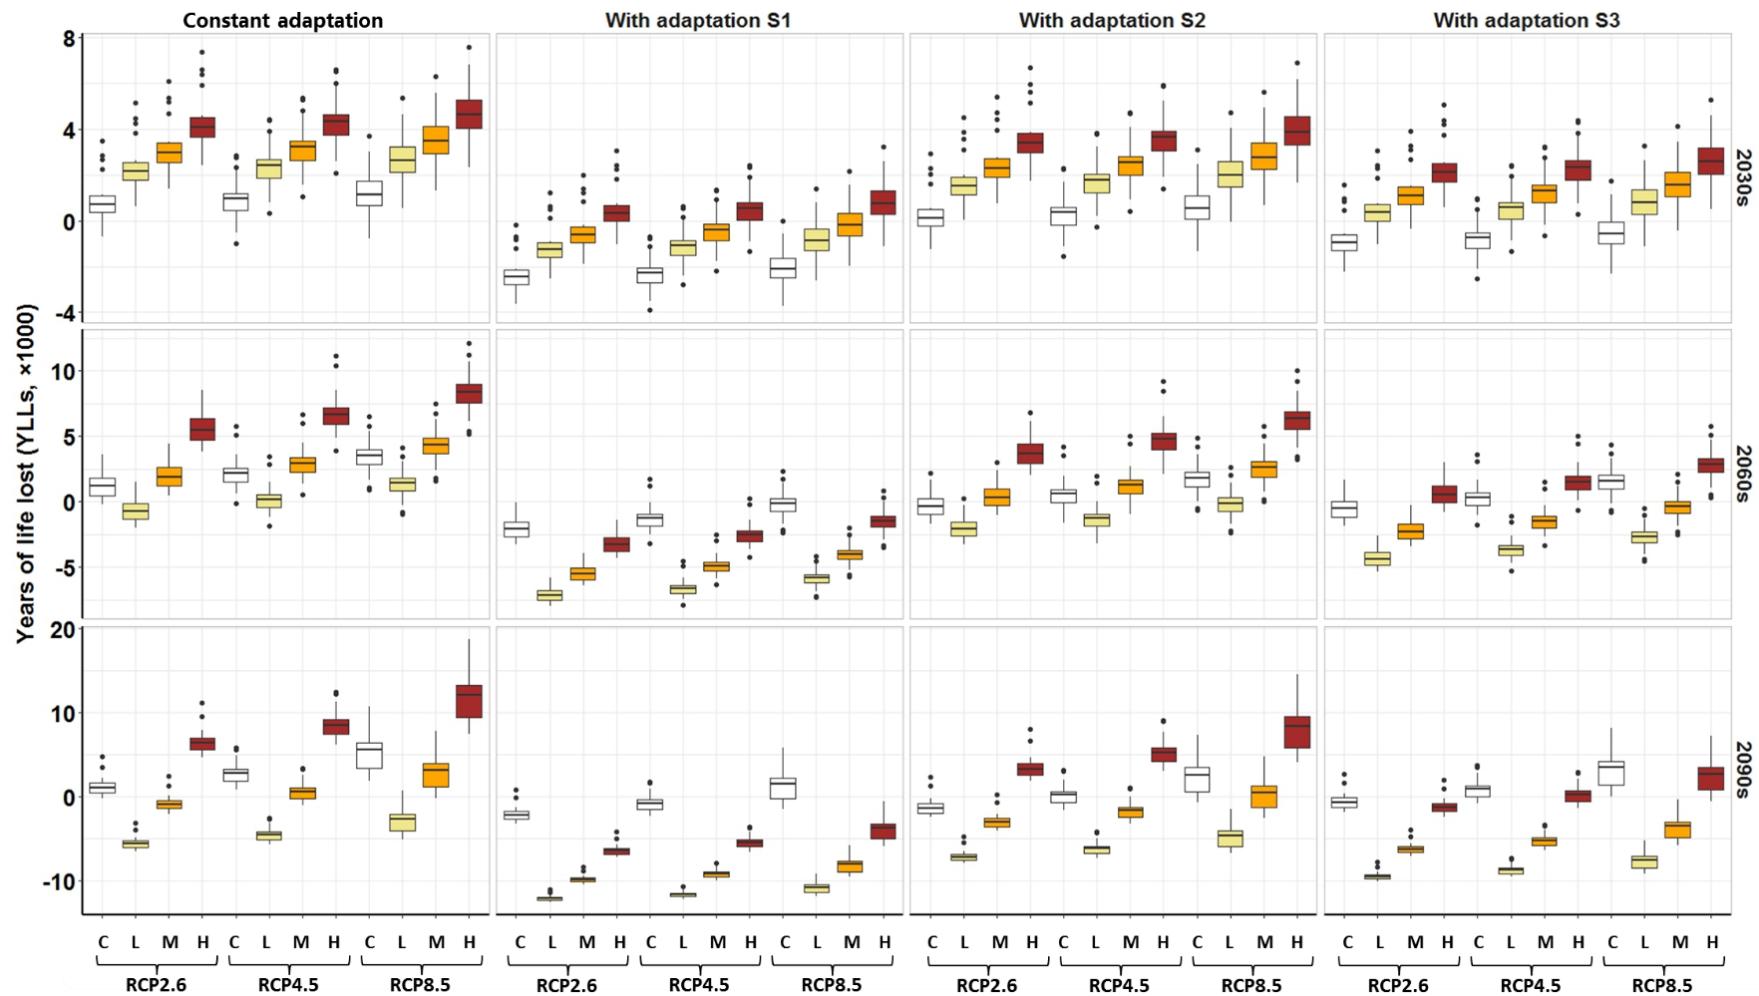

**Figure S5.** Relationship between daily TM and YLLs in males, females and the population < 65 years during 2010-2015 in Guangzhou, China.

Note: All effects of TM on YLLs were adjusted for secular trend, wind speed, day of week, relative humidity,  $\text{SO}_2$ ,  $\text{NO}_2$  and  $\text{PM}_{10}$ .

**Figure S6.** Annual heat-related YLLs in males, females and population <65 years in the 2030s, 2060s and 2090s as compared with the 1980s under different climatic scenarios and GCMs.

Note: We assumed that the population size and their adaptation in the 21<sup>st</sup> century will remain constant at the 2010 level. Gray grids meant the data were not available. The heat-related YLLs in the future have been subtracted by the heat-related YLLs in the 1980s.

**Figure S7.** Impacts of population expansion and adaptation on the annual heat-related YLLs in males in Guangzhou in the 2030s, 2060s and 2090s under different scenarios.

Constant adaptation: People's adaptation to high temperature will remain constant at the 2010 level.

Adaptation S1: People's adaptation to high temperature will increase by 8.92% per decade.

Adaptation S2: People's adaptation to high temperature will increase by 4.60% per decade.

Adaptation S3: People's adaptation to high temperature will increase by 0.2°C per decade.

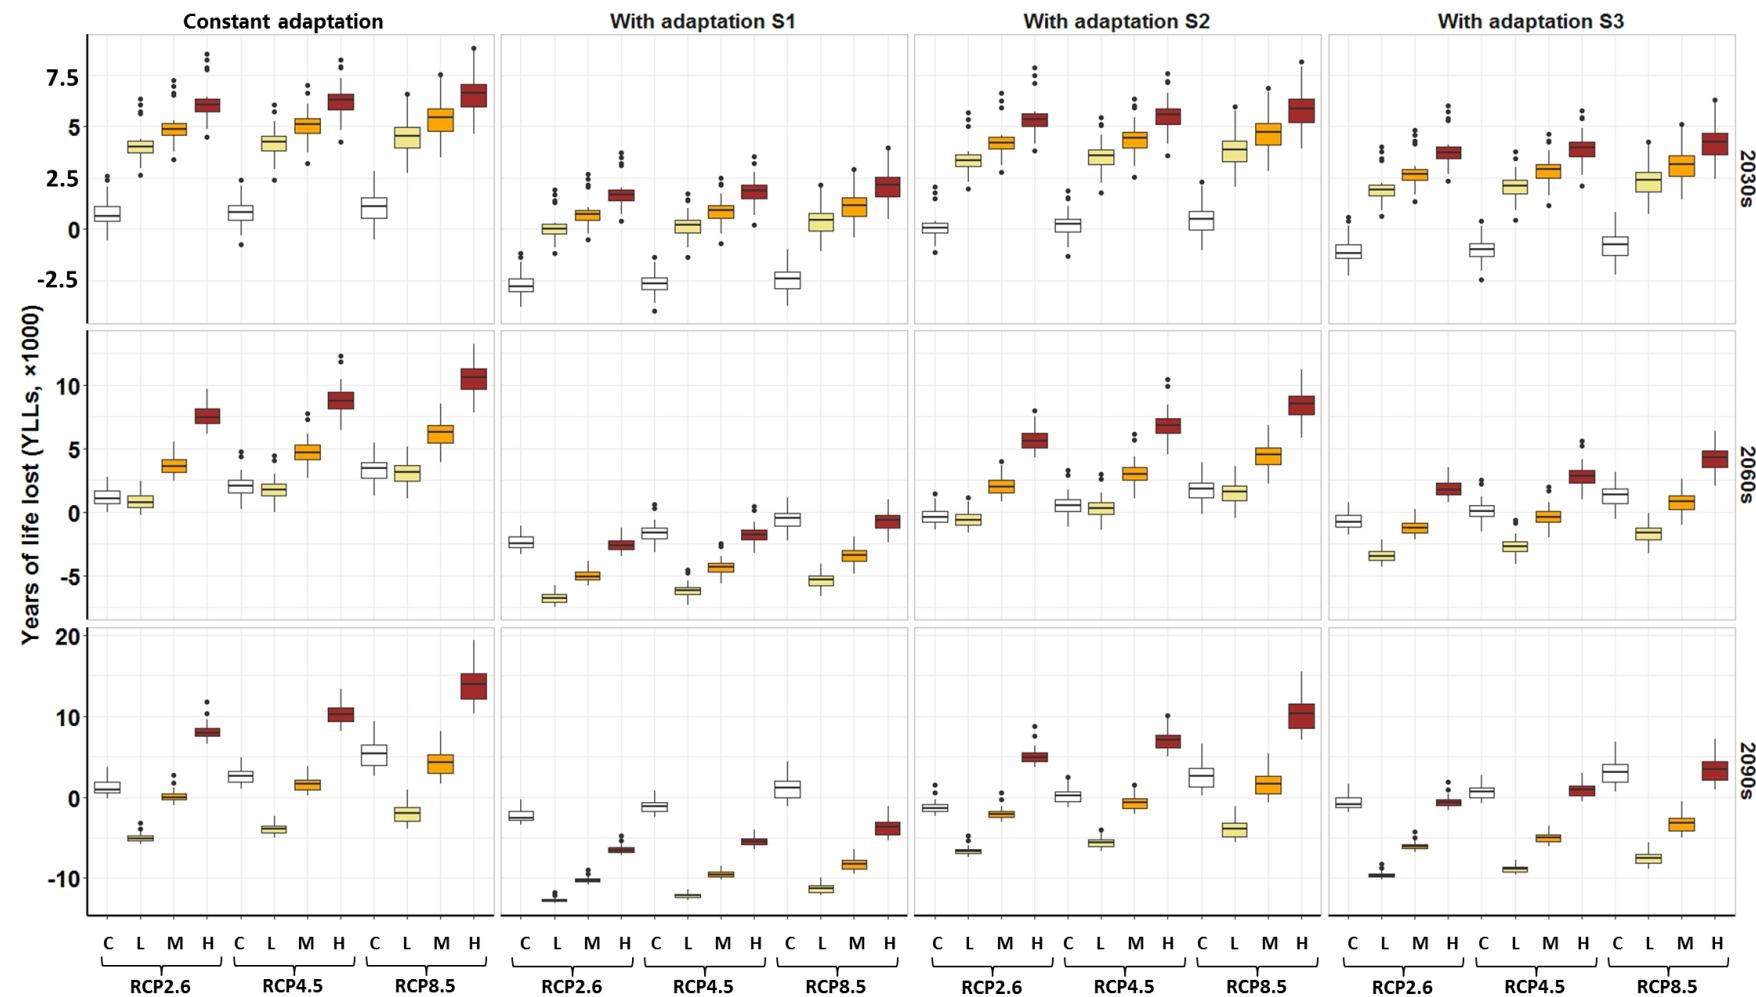

C: The population size will remain constant at the 2010 level.

L: Low population expansion scenario.

M: Medium population expansion scenario.

H: High population expansion scenario.

The heat-related YLLs in the future have been subtracted by the heat-related YLLs in the 1980s.

**Figure S8.** Impacts of population expansion and adaptation on the annual heat-related YLLs in females in Guangzhou in the 2030s, 2060s and 2090s under different scenarios.

Constant adaptation: People's adaptation to high temperature will remain constant at the 2010 level.

Adaptation S1: People's adaptation to high temperature will increase by 8.92% per decade.

Adaptation S2: People's adaptation to high temperature will increase by 4.60% per decade.

Adaptation S3: People's adaptation to high temperature will increase by 0.2°C per decade.

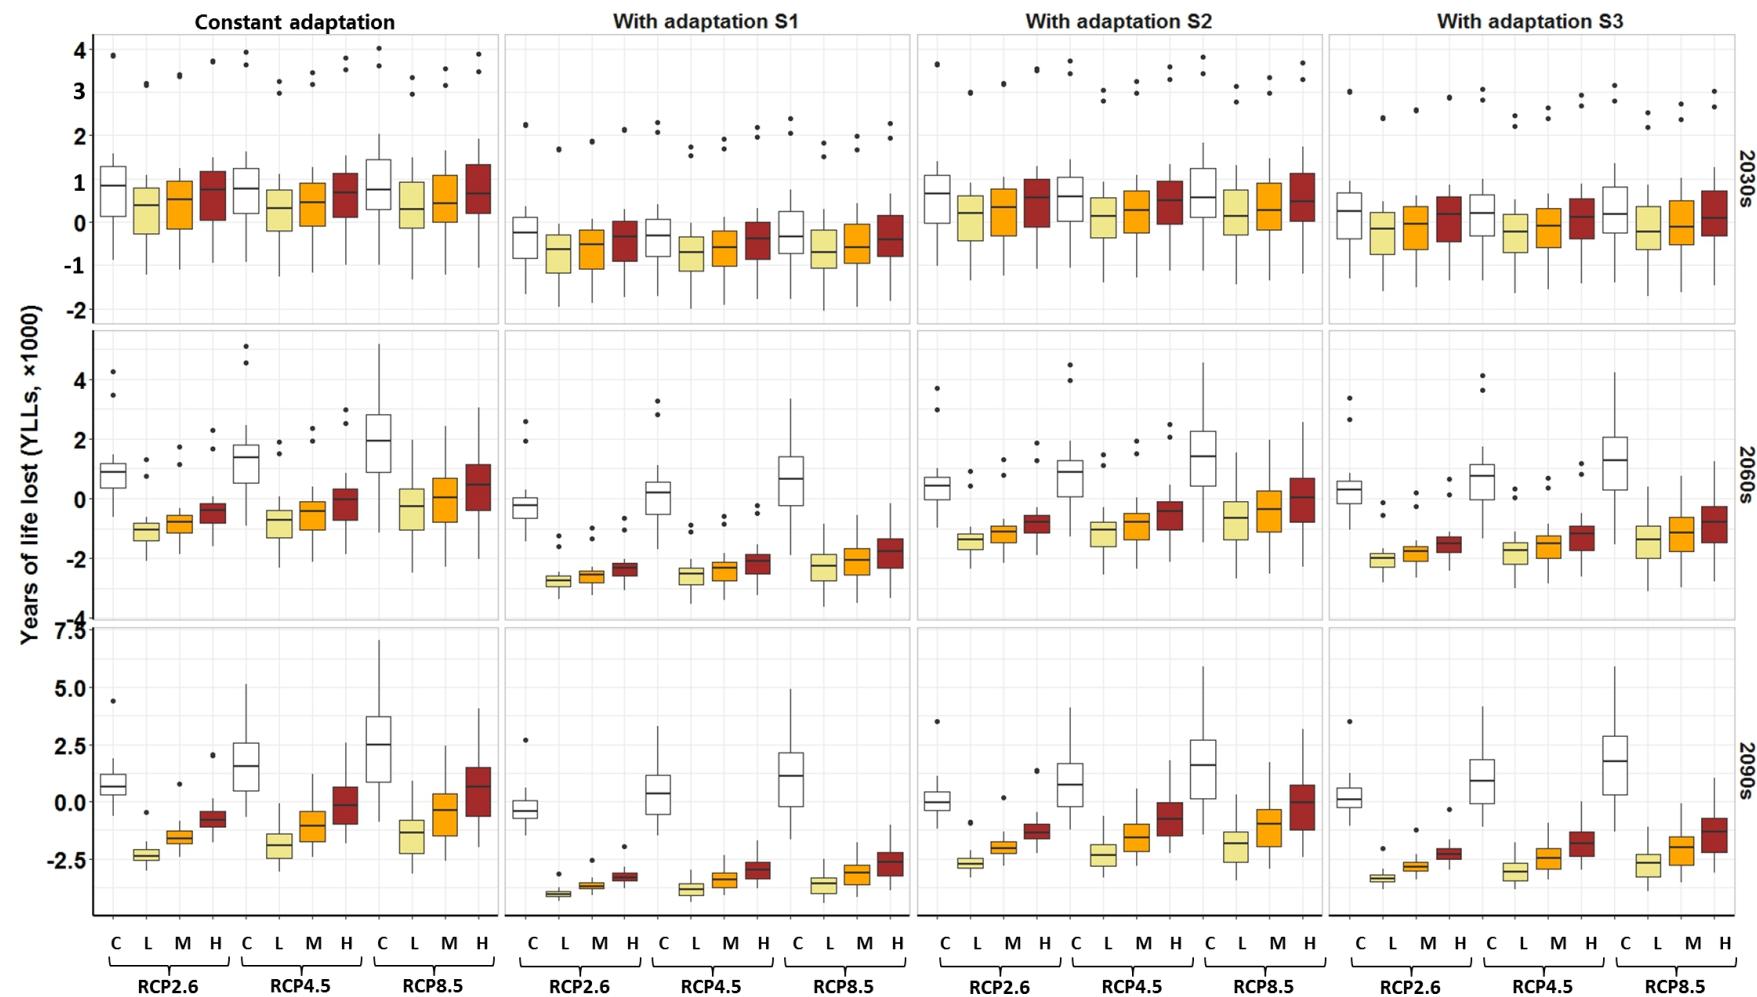

C: The population size will remain constant at the 2010 level.

L: Low population expansion scenario.

M: Medium population expansion scenario.

H: High population expansion scenario.

The heat-related YLLs in the future have been subtracted by the heat-related YLLs in the 1980s.

**Figure S9.** Impacts of population expansion and adaptation on the annual heat-related YLLs in people <65 years in Guangzhou in the 2030s, 2060s and 2090s under different scenarios.

Constant adaptation: People's adaptation to high temperature will remain constant at the 2010 level.

Adaptation S1: People's adaptation to high temperature will increase by 8.92% per decade.

Adaptation S2: People's adaptation to high temperature will increase by 4.60% per decade.

Adaptation S3: People's adaptation to high temperature will increase by 0.2°C per decade.

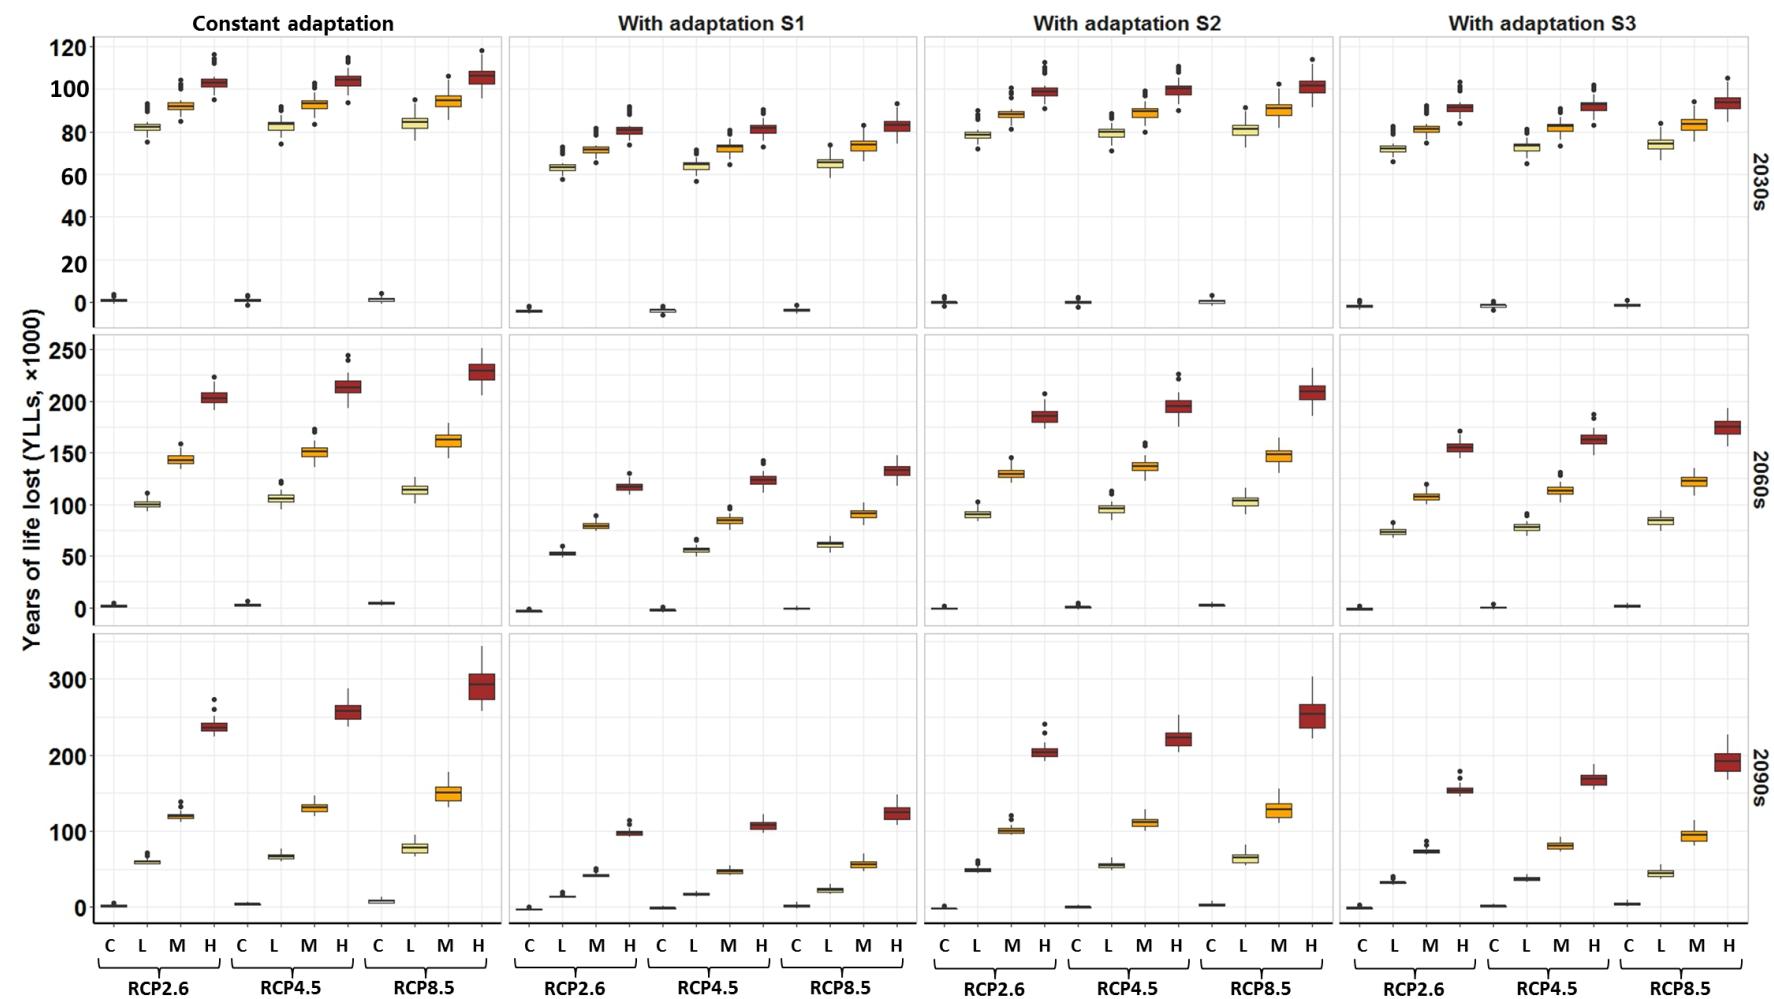

C: The population size will remain constant at the 2010 level.

L: Low population expansion scenario.

M: Medium population expansion scenario.

H: High population expansion scenario.

The heat-related YLLs in the future have been subtracted by the heat-related YLLs in the 1980s.

**Figure S10.** Impacts of population expansion and adaptation on the annual heat-related YLLs in the elderly population in Guangzhou in the 2030s, 2060s and 2090s under different scenarios.

Constant adaptation: People's adaptation to high temperature will remain constant at the 2010 level.

Adaptation S1: People's adaptation to high temperature will increase by 8.92% per decade.

Adaptation S2: People's adaptation to high temperature will increase by 4.60% per decade.

Adaptation S3: People's adaptation to high temperature will increase by 0.2°C per decade.

C: The population size will remain constant at the 2010 level.

L: Low population expansion scenario.

M: Medium population expansion scenario.

H: High population expansion scenario.

The heat-related YLLs in the future have been subtracted by the heat-related YLLs in the 1980s.

**Table S4.** Increase rate ( $\beta$ , P) of heat-related YLLs for each unit increase in population size and aging degree under different scenarios.

	Constant adaptation			With adaptation S1			With adaptation S2			With adaptation S3

Males ( $\times 1000^*$ )	3.79 (0.039)	4.08 (0.039)	4.60 (0.039)	1.80 (0.039)	1.93 (0.039)	2.18 (0.039)	3.32 (0.039)	3.58 (0.039)	4.03 (0.039)	260 (0.039)	2.80 (0.039)	3.16 (0.039)
Females( $\times 1000^*$ )	4.28 (0.034)	4.59 (0.034)	5.17 (0.034)	2.03 (0.034)	2.17 (0.034)	245 (0.034)	3.81 (0.034)	409 (0.034)	4.61 (0.034)	2.94 (0.034)	3.15 (0.034)	3.55 (0.034)
People <65 years ( $\times 1000^*$ )	0.74 (0.048)	0.80 (0.048)	0.92 (0.048)	0.35 (0.048)	0.38 (0.048)	0.44 (0.048)	0.66 (0.048)	0.71 (0.048)	0.82 (0.048)	0.51 (0.048)	0.55 (0.048)	0.63 (0.048)
Elderly( $\times 1000^*$ )	38.59 (0.033)	41.3 (0.033)	46.45 (0.033)	18.27 (0.033)	19.56 (0.033)	22.0 (0.033)	33.84 (0.033)	36.24 (0.033)	40.79 (0.033)	26.47 (0.033)	28.34 (0.033)	31.87 (0.033)
Aging degree#	443.1 (0.023)	467.7 (0.022)	514.4 (0.02)	258.9 (0.039)	270.5 (0.038)	292.6 (0.035)	400.1 (0.025)	421.8 (0.024)	463.1 (0.022)	333.3 (0.031)	350.1 (0.029)	382.2 (0.027)

Constant adaptation: People's adaptation to high temperature will remain constant at the 2010 level.

Adaptation S1: People's adaptation to high temperature will increase by 8.92% per decade.

Adaptation S2: People's adaptation to high temperature will increase by 4.60% per decade.

Adaptation S3: People's adaptation to high temperature will increase by 0.2°C per decade.

$\beta$  is the coefficient in the linear regression between heat-related YLLs and the percentage of population increase and aging degree.

The heat-related YLLs in the future have been subtracted by the heat-related YLLs in the 1980s.
