Supplemental material content

- Figure S1. Flowchart of included population.
- Figure S2. Example of children's follow-up.
- Figure S3. Directed acyclic graph (DAG) for childhood overweight and obesity and play spaces exposure.
- Figure S4. Estimated linearity between play space exposures and childhood overweight or obesity.
- Figure S5. Spearman correlations matrix between the outdoor residential play spaces indicators (overall, green and diversity of them).
- Table S1. Population description and residential proximity to play spaces distribution and bivariate analysis by sex (N = 75608).
- Table S2. Bivariate analysis of childhood overweight developed during follow-up by area SES (quintiles of deprivation) (N = 22215).
- Table S3. Association between residential proximity to play spaces and the development of childhood obesity (excluding overweight) (N = 83975).
- Table S4. Adjusted association between residential proximity to play spaces and the development of childhood obesity (excluding overweight) by area SES (quintiles of deprivation) (N = 83975).
- Table S5. Adjusted association between residential proximity to play spaces and the development of childhood overweight by non-movers during follow-up period (N = 57654).
- Table S6. Adjusted association between residential proximity to play spaces and the development of childhood overweight adjusting for Spanish and non-Spanish nationality (N = 75608).
- Table S7. Adjusted association between residential proximity to play spaces and the development of childhood overweight by sex adjusting for additional maternal characteristics (maternal nationality and maternal BMI) (N = 14645).

Figure S1. Flowchart of included population.

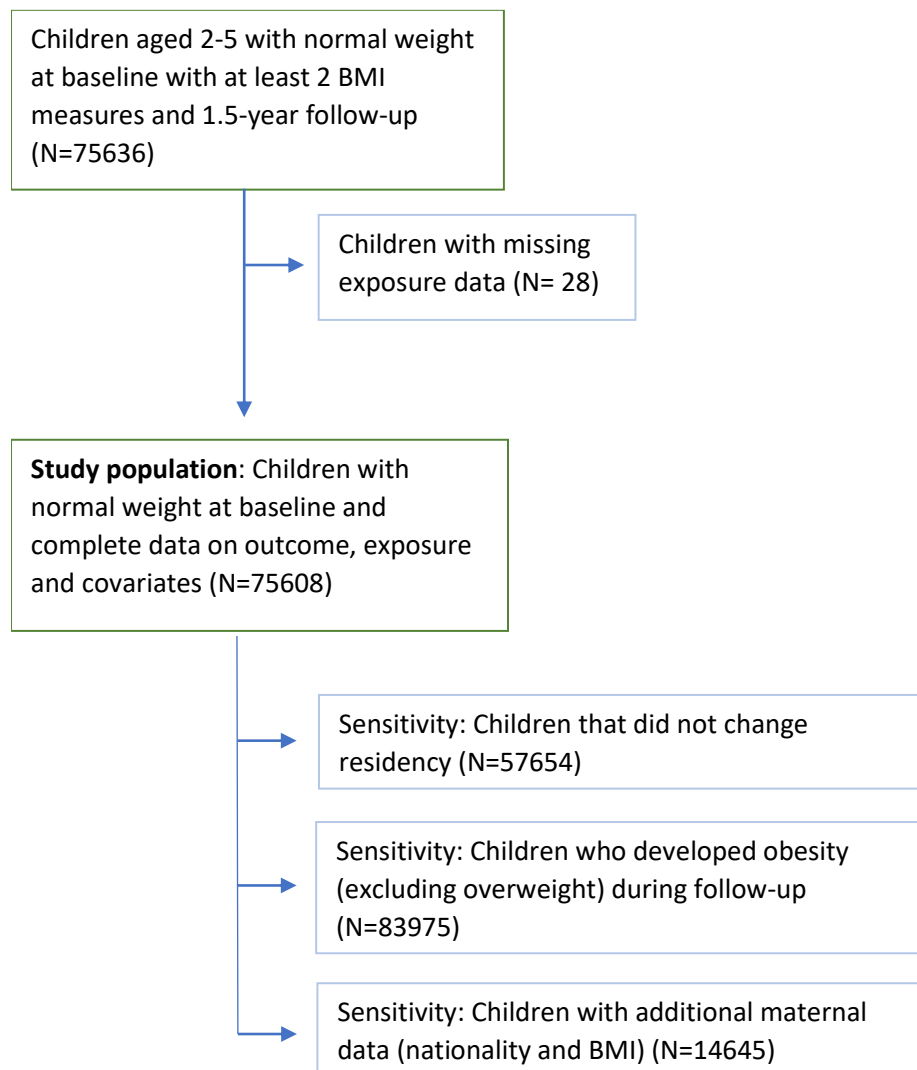

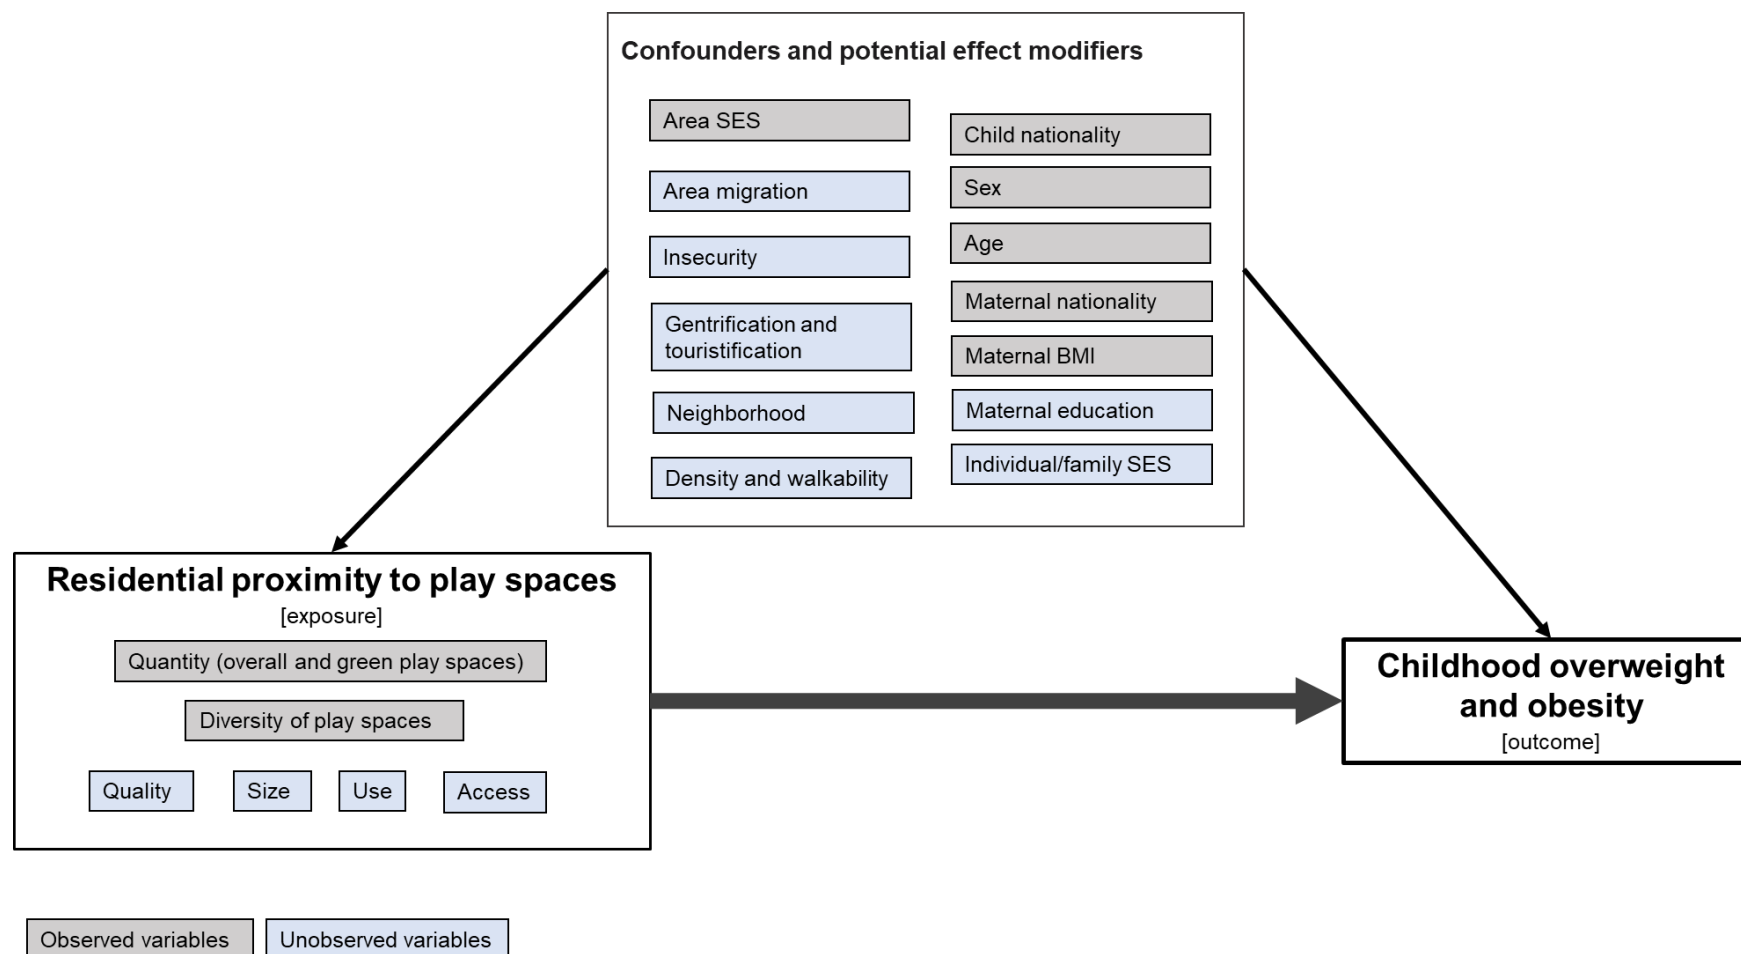

Figure S2. Example of children’s follow-up.

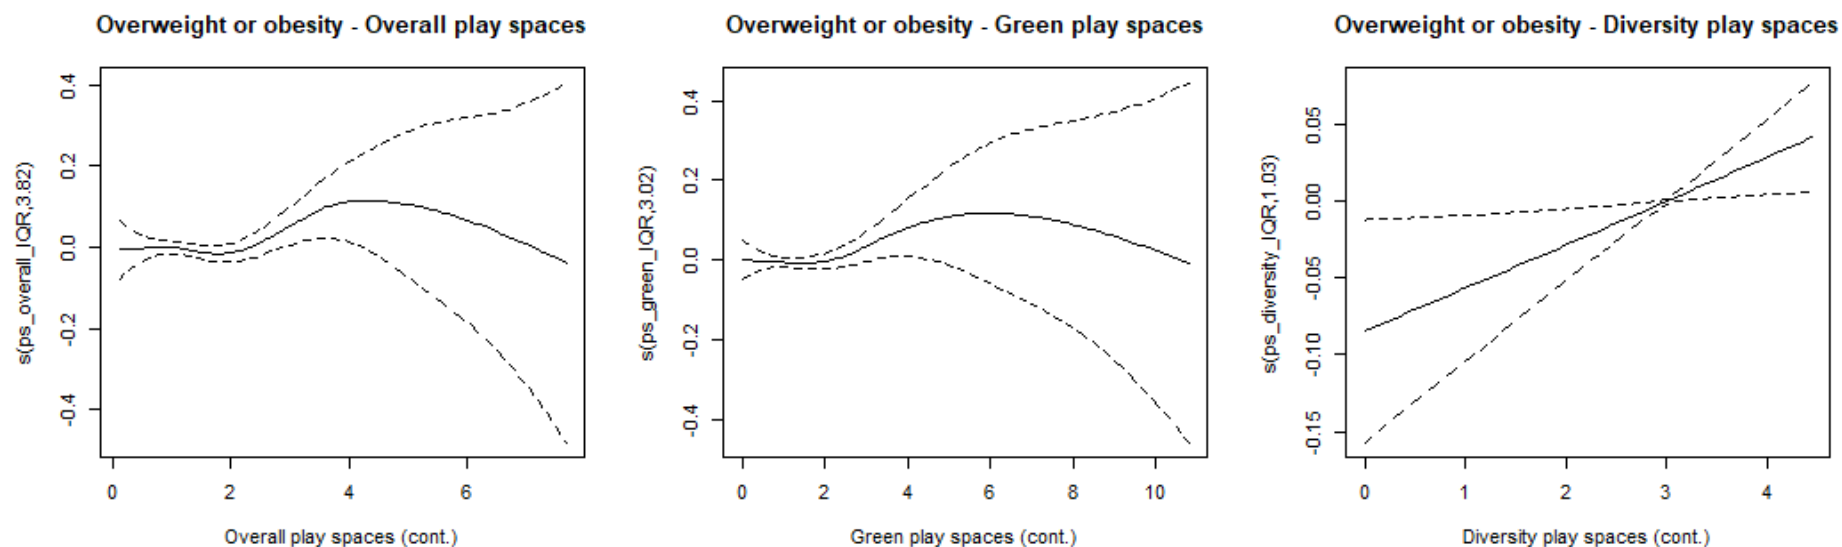

*When individuals reach 15 years old, become overweight or obese, transfer-out of SIDIAP, or die.

Figure S3. Directed acyclic graph (DAG) for childhood overweight and obesity and play spaces exposure.

Source: self-made

Figure S4. Estimated linearity between play space exposures and childhood overweight or obesity.

Note: We examined the linear relationship between each play space exposure indicator and childhood overweight or obesity using generalized additive models (GAM). These Models are adjusted by child's age at baseline (categorical), population aged 2-14 living in the children's residential area, child's sex, child nationality and area deprivation index.

Figure S5. Spearman correlations matrix between the outdoor residential play spaces indicators (overall, green and diversity of them).

* p-value < 0.05.

Table S1. Population description and residential proximity to play spaces distribution and bivariate analysis by sex (N=75608).
