

Figure S3. Photographs of the entire membrane used to generate Figure 1, panel C. Spleen cells from indicated lines of mice were cultured for two days by adding PBS alone (none) or PBS containing LPS, and their proteins were dissolved in the lysis buffer and diluted with SDS-PAGE sample buffer. After electrophoresis, blotted proteins were probed with the anti-FLAG or anti-actin Ab. Right 4 lanes are irrelevant to the present study. Mr, relative molecular mass (kDa).
