

Supplementary Figure S1. Supplementary Figure S2. Cell viability of PDAC cell lines upon infection with GoraVir and HAdV-C5. BxPC-3, HPAF-II, and MIA PaCa-2 cells were infected with A) GoraVir or B) HAdV-C5 at various MOI and cell viability was measured at 6 days post infection. Represented is the mean cell viability relative to uninfected cells. Depicted are mean and SD of n=3 biologically independent experiments each performed in triplicate.
