Supplementary Tables

Supplementary Table S1: Patient comorbidities and treatments

Characteristic	Stratum	N (%)
Number of comorbidities	5	1 (1.0%)
	4	5 (5.3%)
	3	13 (13.8%)
	2	30 (31.9 %)
	1	23 (24.5.0%)
	0	22 (23.4 %)
Types of comorbidities	None listed	22 (23.4%)
	Hypertension	42 (44.7%)
	Diabetes	32 (34.0 %)
	Obesity (BMI ≥ 30)*	22 (23.4%)
	Pulmonary	15 (16.0%)
	Renal	10 (10.6%)
	Cardiovascular	13 (13.8 %)
	Cancer	10 (10.6%)
	Dyslipidemia	6 (6.4 %)
Treatments	Hypothyroidism	5 (5.3%)
	ICU	30 (31.9%)
	Corticosteroids	51 (54.3%)
	Tocilizumab	24 (25.5 %)
	Oxygen	57 (60.6%)
	Intubation	7 (7.4%)
	ECMO	3 (3.2%)
	Antibiotics	36 (38.3%)

*BMI available for only 46 patients

Gravrand et al. (2023) Stratification of COVID-19 with SeptiCyte RAPID

Supplementary Table S2 : Distribution of SARS-CoV-2 (+) patients across COVID-19 severity categories and hospital locations. COVID-19 severity assessments were made on the basis of chest CT scans, conducted within 24 hours of SeptiCyte RAPID measurement. Range is specified in [] square brackets, and percentage is specified in () parentheses. The median values for age and the median time between onset of symptoms and SeptiCyte result are reported for those patients with CT scan results.

	Emergency Department (Fig 1a) (n=67 total; 49 with CT scan results)					ICU (Fig 1b)	Conventional Unit,Viremia (Fig. 1c)
Follow-up	Discharged (< 24 hours in ED)	Conventional Hospitalization	Delayed ICU admission	Immediate ICU admission	Deceased in ED		
n (total) = 94	25	33	4	3	2	23	4
n (with CT scan result)	12	30	4	2	1	15	4
F/M (with CT scan result)	6/6	13/17	2/2	0/2	1/0	6/9	1/3
Median age, years	58 [20 – 84]	71 [23 – 96]	66 [63 – 66]	77 [76 – 78]	85	59 [27 – 78]	57 [38 – 67]
Median time between onset of symptoms and SeptiCyte result, days (symptomatic patients)	7 (n=11) [1 – 12]	7 (n=28) [0 – 30]	6 (n=4) [4 – 9]	8.5 (n=2) [7 – 10]	NA	10 [1 – 24]	9 [9 – 11]
Radiologic injury, n (%)							
Absence (0%)	5 (20%)	1 (3%)	0	0	0	0	0

	Emergency Department (Fig 1a) (n=67 total; 49 with CT scan results)					ICU (Fig 1b)	Conventional Unit,Viremia (Fig. 1c)
Follow-up	Discharged (< 24 hours in ED)	Conventional Hospitalization	Delayed ICU admission	Immediate ICU admission	Deceased in ED		
Mild (present but <10 %)	1 (4%)	8 (24%)	0	0	0	0	1 (25%)
Moderate [10 – 25 %]	4 (16%)	8 (24%)	1 (25%)	0	1 (50%)	2 (8.7%)	1 (25%)
Extensive (25 - 50 %)	1 (4%)	11 (33%)	1 (25%)	1 (33.3%)	0	4 (17%)	2 (50%)
Severe [50 – 75 %]	0	1 (3%)	1 (25%)	1 (33.3%)	0	6 (26%)	0
Critical (> 75 %)	0	0	0	0	0	3 (13.1%)	0
Not specific	1 (4%)	1 (3%)	1 (25%)	0	0	0	0
Not performed	13 (52%)	3 (9.1%)	0	1 (33.3%)	1 (50%)	8 (34.8%)	0

Supplementary Table S3: Logistic Regression models (see Figures. 4A, 4B in main text). A complete permutation analysis of different logistic combinations of up to six variables (SeptiScore, monocytes, CD16-monocytes, D-dimer, lactate and CRP) was conducted, resulting in 63 independent logistic regression models. The models were used to discriminate Critical + Severe in ICU (n=13) vs. Moderate + Mild not in ICU (n = 24) and their AUC values were calculated. Interquartile ranges for AUC were obtained by resampling from 100 replicate datasets. Missing values in the line data were imputed using Amelia, a multiple imputation algorithm [Reference 15 in main text]. Multiple imputation is claimed to have reduced bias and increased accuracy over point-imputation methods such as "mean" or "median" imputation [Reference 15 in main text]. Abbreviations: CRP, C-reactive protein; Mono, monocytes; Mono.CD16, CD16-monocytes.

Model	variables	MEAN	MEDIAN	25%	75%
1	CRP	0.867	0.871	0.860	0.890
2	D-dimer	0.630	0.640	0.576	0.679
3	Lactate	0.668	0.680	0.607	0.729
4	Mono	0.725	0.722	0.703	0.748
5	Mono.CD16	0.750	0.752	0.698	0.791
