

Supplementary Figure S1. A schematic representation of the overlapping RT-PCRs used to obtain longer ORF1b sequences (~950 bp, encoding a significant region (~315 aa) of the putative RdRp) from the AstVs detected in mongooses (designated as Mon-AstVs). The nt positions shown here are those at corresponding positions of the nt sequence of Hainan gekko similignum astrovirus strain LPXYC188631 (GenBank accession number MG599917). Abbreviations: aa, amino acid; AstVs, astroviruses; nt, nucleotide; ORF, open reading frame; RdRp, RNA-dependent RNA polymerase.
