

Supplementary Materials: Matrix Effects of the Hydroethanolic Extract of Calyces of *Physalis peruviana* L. on Rutin Pharmacokinetics in Wistar Rats Using Population Modeling

Gina Paola Domínguez Moré, María Isabel Cardona, Paula Michelle Sepúlveda, Sandra Milena Echeverry, Cláudia Maria Oliveira Simões and Diana Marcela Aragón

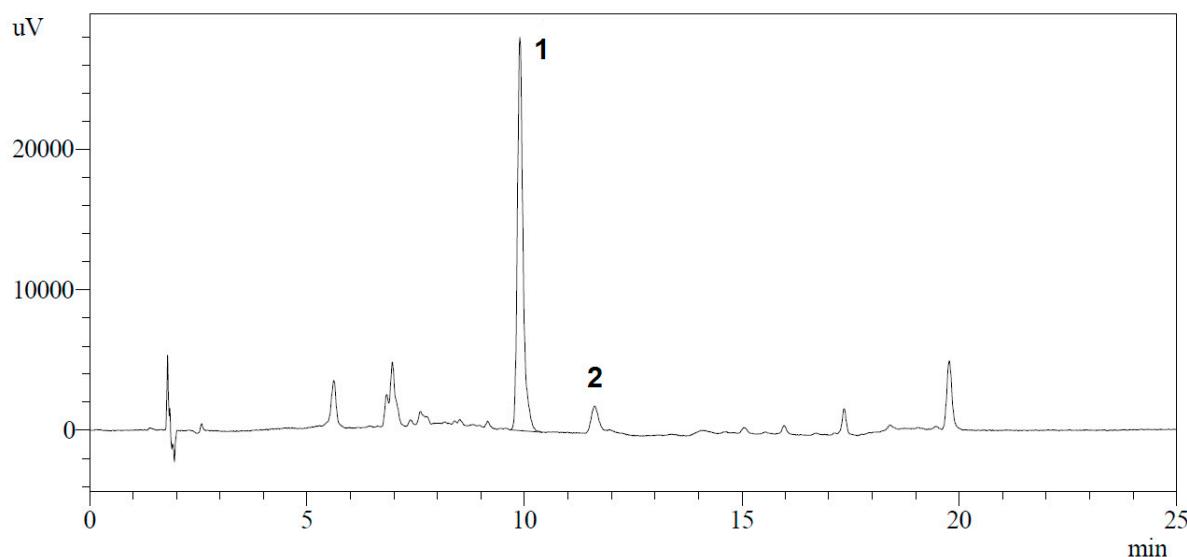

Figure S1. Chromatographic profile of the hydroethanolic extract of calyces from *Physalis peruviana*. **1:** rutin, retention time 9.8 min. **2:** Nicotiflorin, retention time 10.5 min. Column C18 (150 × 3.9 mm, 10 μ m), mobile phase with methanol (A) and water, acidified with acetic acid at 0.5%, in gradient from 10 to 80% A, over 25 min at 1 mL/min; column oven at 35°C, detection at 350 nm and injections of 10 μ L of the samples diluted in methanol (1 mg/mL) [39].

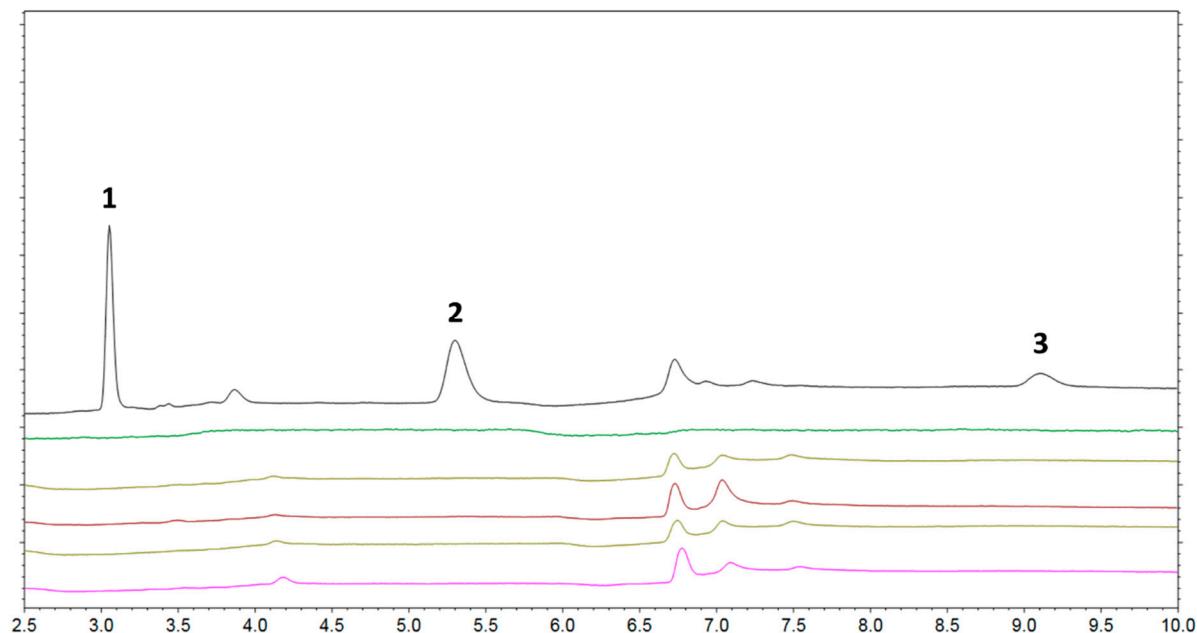

Figure S2. Selectivity and specificity of the bioanalytical method. Colored lines are blank samples from different rats. Black line is blank plasma spiked with rutin (peak 1, 3.1 min) and quercetin (peak 2, 5.4 min) at concentration of 250 ng/mL, the internal standard (IS) chrysanthemic acid (peak 3, 9.1 min) at concentration of 1000 ng/mL and quercetin-3-O-glucuronide for potential interference evaluation. There was not interfering signals for the analytes and IS. Column Kinetex® EVO C18, 2,6 µm, 100 × 2.1 mm at 30°C, mobile phase with formic acid 0.1% (A) and acetonitrile acidified with formic acid at 0.5%, in gradient from 85 to 65% A, at 0.5 mL/min. Detection at 260 nm and injections of 6 µL of the samples. Samples were prepared by protein precipitation with methanol (1:2).

Table S1. Summary of run record for modelling of rutin in intravenously administration experiments.
