Sample Treating before HPLC Injection for Digest Analysis

After simulated gastric digestion: 1) To determine the total *trans*-anethole amount, 500 μL of acetonitrile was added to 500 μL of (neutral) gastric digest. The mixture, after vortexing, was centrifuged (10 min at $10000 \times g$), and, then, 200 μL of the supernatant was diluted with 800 μL of acetonitrile before HPLC injection. 2) To determine the free *trans*-anethole, the sample was centrifuged at $21,00 \times g$ as previously depicted in paragraph 2.4.2., and then 500 μL of supernatant was treated as above described for the total amount. The encapsulated *trans*-anethole amount was obtained by difference (total – free).

After simulated digestion (gastric + intestinal): 500 μL of EtOH was added to 500 μL of the methanol-treated supernatant. The mixture, after vortexing, was centrifuged (10 min at $10,000 \times g$), then, 400 μL of the supernatant was diluted with 600 μL of acetonitrile, and, after centrifugation (5 min at $3500 \times g$) an aliquot of this mixture was injected in HPLC.
